

# Chronic Myeloid Leukemia - ASH 2016 -

Neil Shah, MD PhD

*Edward S. Ageno Distinguished Professor in Hematology/Oncology*

*Director, Molecular Medicine Residency Program*

*Leader, Hematopoietic Malignancies Program*

*Helen Diller Family Comprehensive Cancer Center at UCSF*

*San Francisco, California*

# Leukemias: overview

- Acute Lymphoblastic Leukemia (ALL)
- Acute Myeloid Leukemia (AML)
- Chronic Lymphocytic Leukemia
- **Chronic Myeloid Leukemia (CML)**

# CML - clinical features

- approximately 4500 new US cases per year
- median age at presentation **53 years**
- men comprise approximately 60 percent of cases
- disease is clinically divided into two phases
  - **chronic phase**
  - **accelerated/ blast crisis phase**

# CML - chronic phase

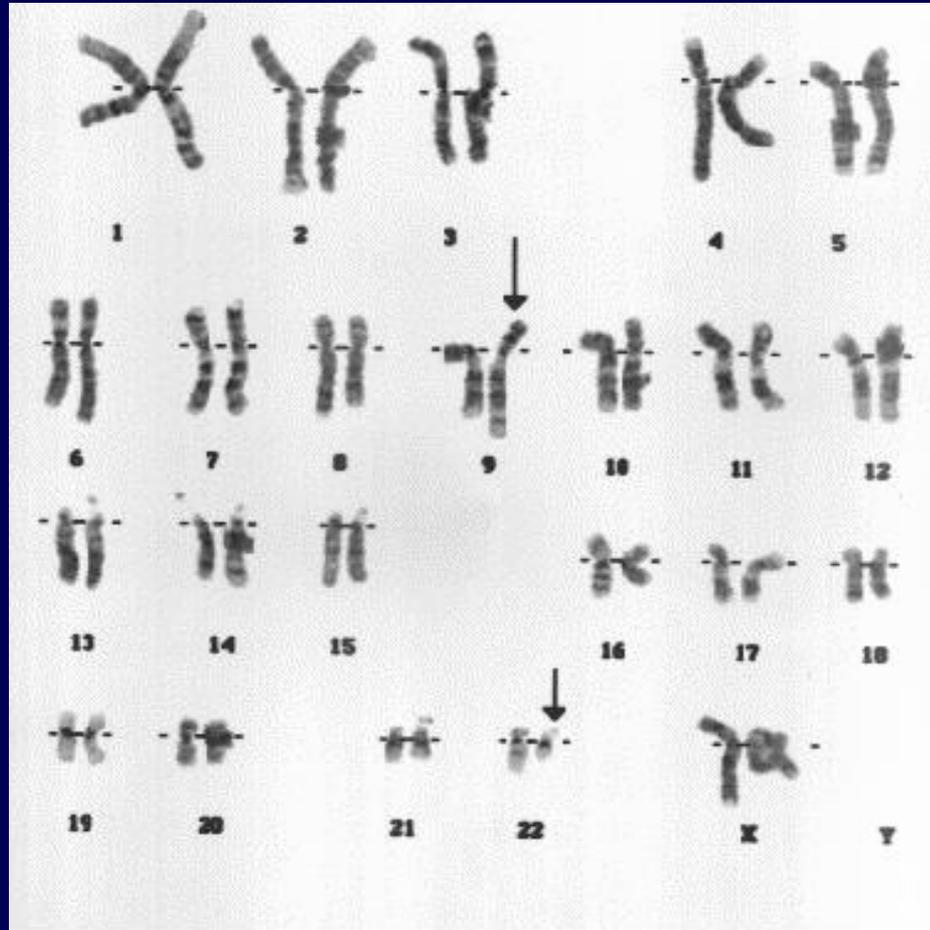

- approximately 40 percent of patients are without symptoms (fatigue)
- 85 percent of newly diagnosed CML cases are chronic phase
- median duration of chronic phase (prior to 2000) approximately 4-6 years
  - After 2000 - unknown, greater than 10 years
- **interventions can lead to durable responses in chronic phase**
  - Medical therapy (interferon, TKIs)
  - Stem cell transplantation

# CML - blast crisis phase

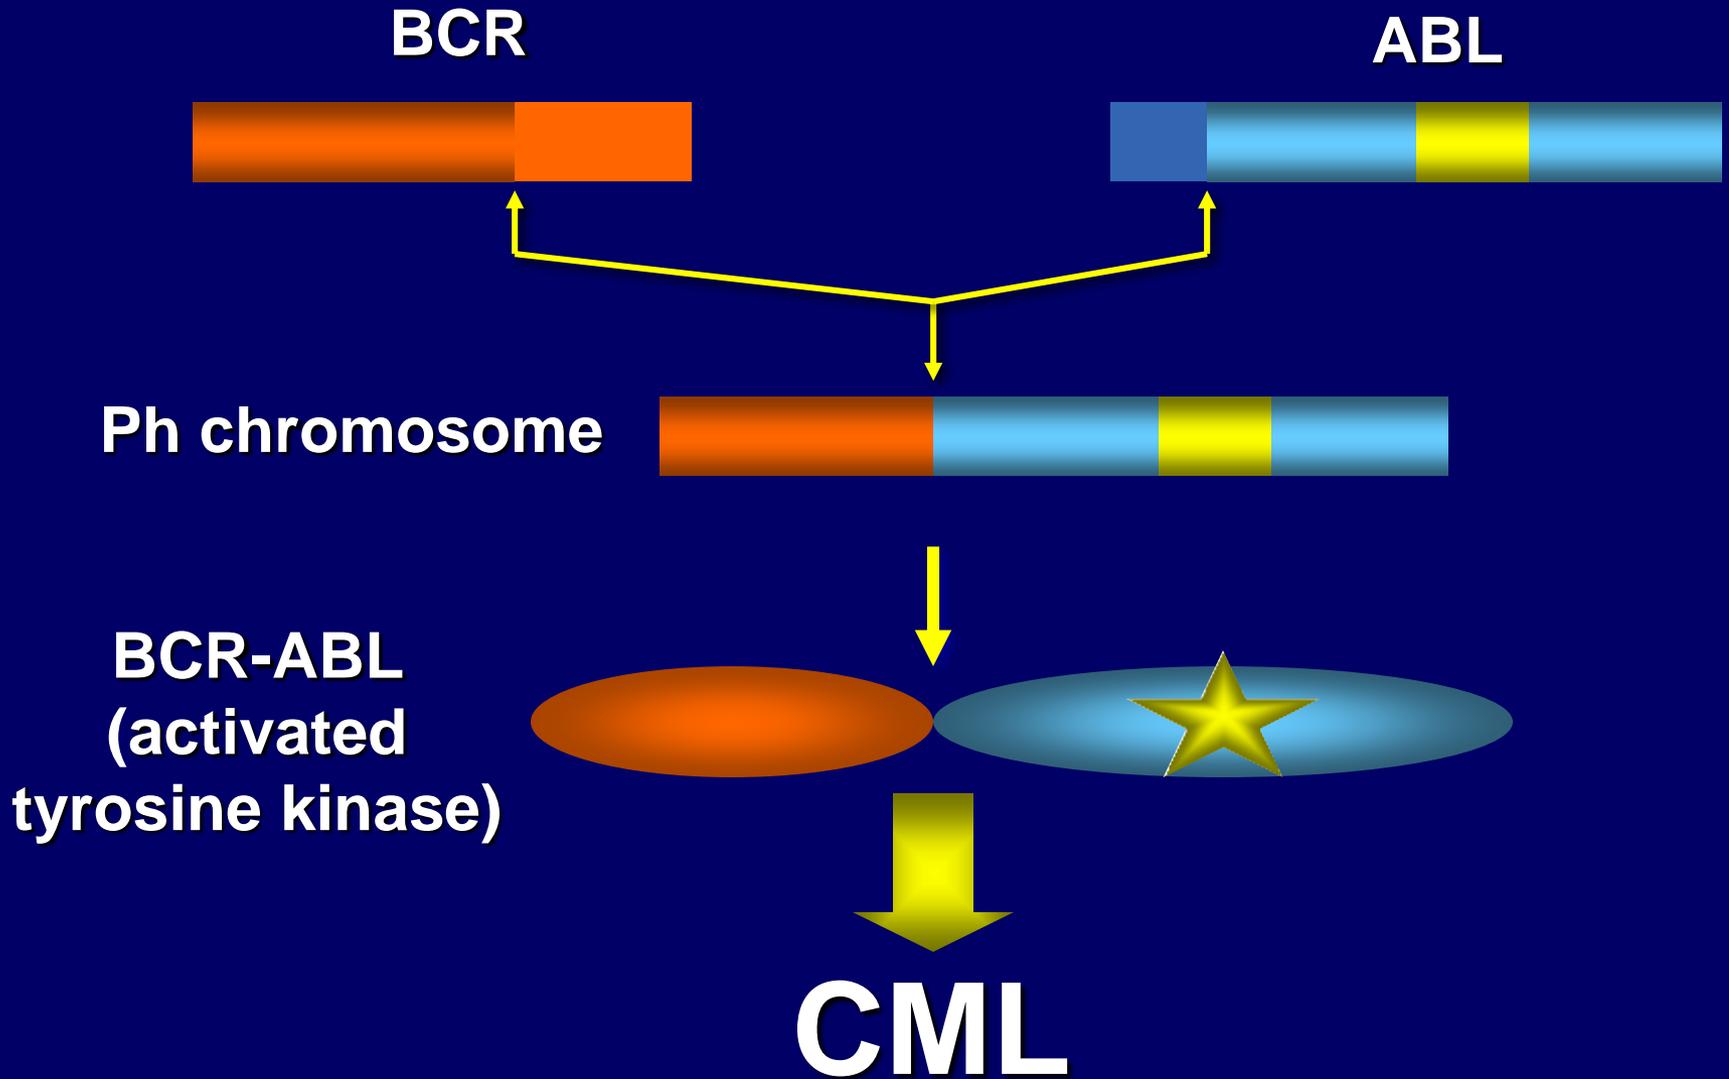

- **failure of normal development of blood cells**
- **responds poorly to medical intervention**
  - **bleeding, infections, anemia common**
- **median survival approximately 6 months**

# First hint at the cause of CML:

46,XX,(9;22)(q34;q11.2)

# The Philadelphia (Ph) Chromosome Leads to CML

# Clinical Course: Phases of CML

Chronic phase	Advanced phases	
	Accelerated phase	Blastic phase (blast crisis)
Median 4–6 years stabilization	Median duration up to 1 year	Median survival 3–6 months

*Cooperating mutations\**

*\*loss of p53; trisomy 8; second Ph; PAX5 deletion; others*

# Chronic Phase CML - Goals of Therapy

- Prevention of disease transformation to blast phase
  - Chronic phase CML is not immediately life-threatening, so if blast phase can be prevented indefinitely, patients will be “functionally” cured
  - Will almost certainly require lifelong therapy
    - Chronically administered therapies should ideally be well-tolerated and minimally intrusive to everyday life
- True disease cure - enabling patients to be off all therapies
  - Allogeneic stem cell transplantation (~70% cure rate)
    - ~20% risk of short-term death (1-2 years)
    - ~50-60% risk of chronic graft vs host disease
      - “trading one disease for another”
  - Interferon-alpha
    - Low, but real, likelihood of effecting deep and durable molecular remissions (more than 20 years)
    - Difficult for many patients to tolerate
      - Long-acting preparation may be better tolerated
        - Signs of efficacy in CML as well as polycythemia vera

# **MONITORING DISEASE IN PATIENTS WITH CML**

# Tools to Monitor Response and Resistance in CML

- Complete Blood Count (CBC)
- Cytogenetics (Quantification of Cells Containing the Philadelphia Chromosome in the Bone Marrow)
- Molecular [Polymerase Chain Reaction (“PCR”) to Quantify the Amount of BCR-ABL in the Blood or Bone Marrow]

# Treatment Response

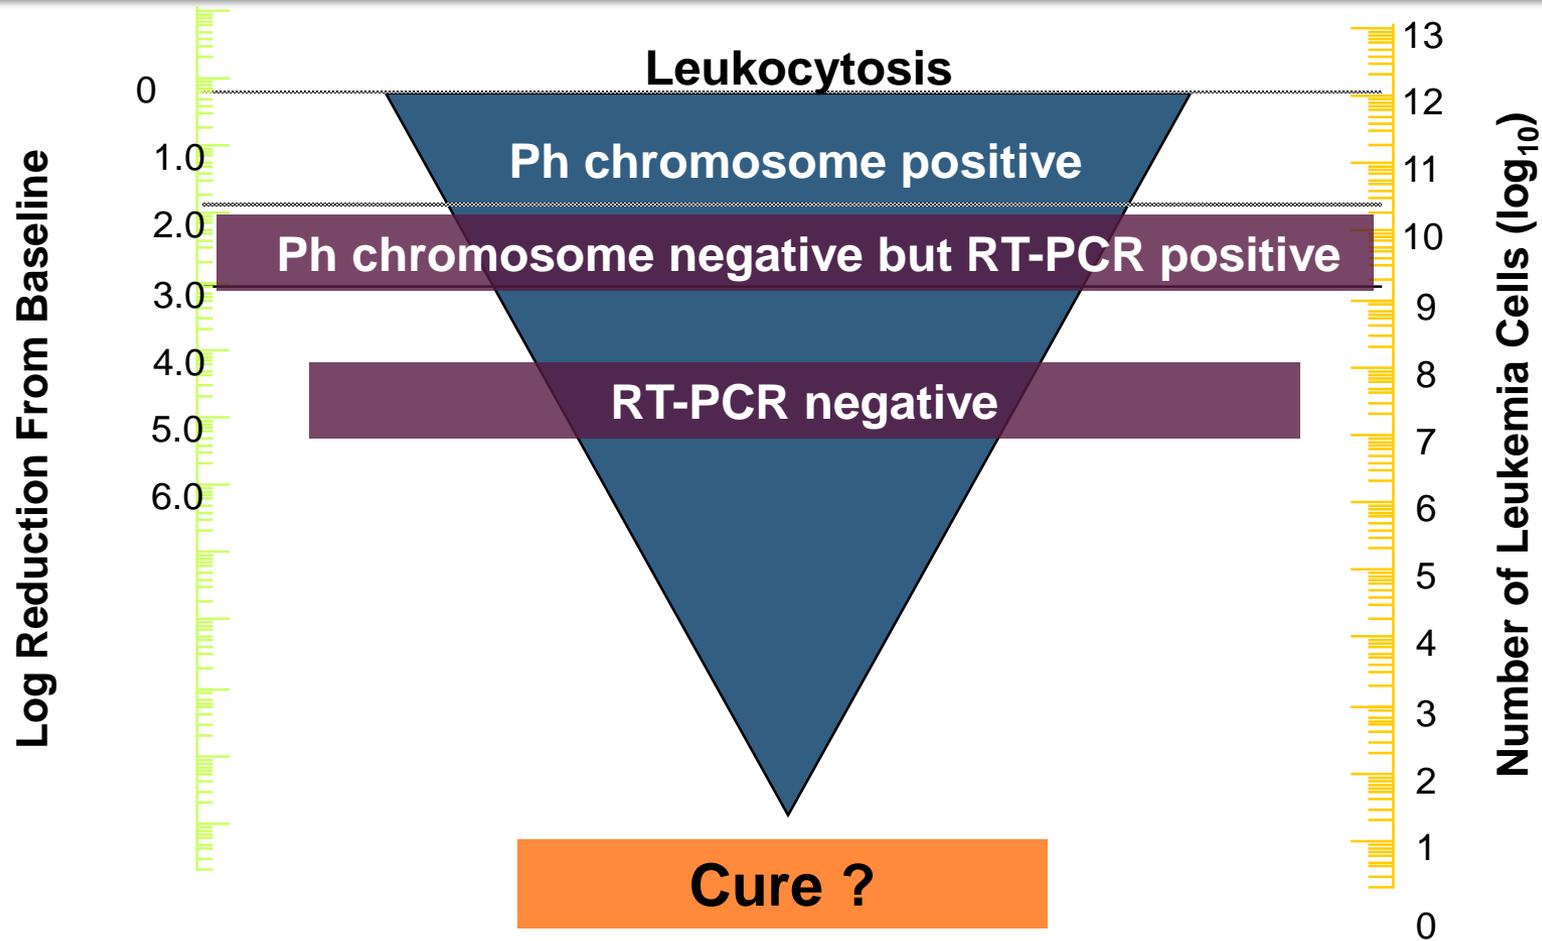

Level of Response	Definition
Complete hematologic response (CHR)	Normal CBC and differential, no extramedullary disease
Minor cytogenetic response	35%–90% Ph-positive metaphases*
Partial cytogenetic response (PCyR) <sup>†</sup>	1%–34% Ph-positive metaphases*
Complete cytogenetic response (CCyR) <sup>†</sup>	0% Ph-positive metaphases*
Major molecular response (MMR)	≥3-log reduction of BCR-ABL
Complete molecular response	Negativity by RT-PCR (≥4.5 log reduction of BCR-ABL)

\*Cytogenetic response is based on analysis of at least 20 metaphases.

<sup>†</sup>PCyR + CCyR = major cytogenetic response (MCyR).

Adapted from NCCN Clinical Practice Guidelines in Oncology: chronic myelogenous leukemia. V.3.2008. <http://www.nccn.org>. Accessed 02/04/2008; Deininger MW. *Hematology Am Soc Hematol Educ Program*. 2005;174-182.

# Log Reduction of BCR-ABL Transcripts in Patients Responding to Treatment

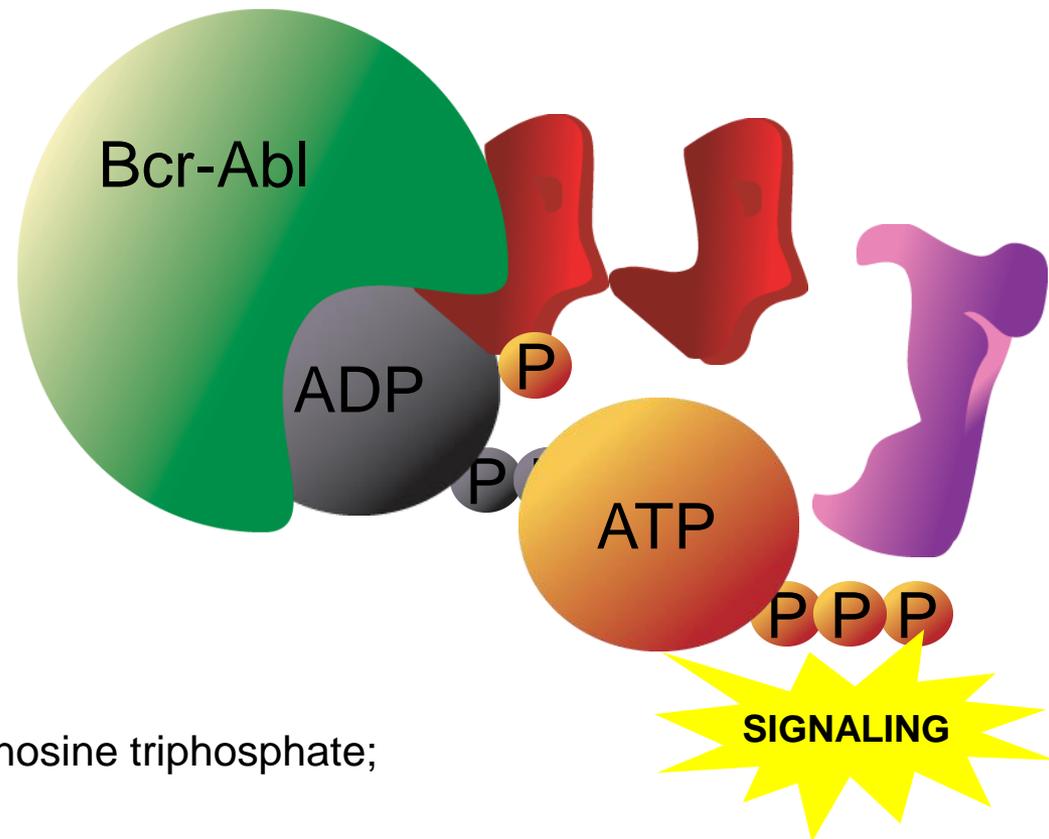

Decreasing residual leukemia

RT-PCR = real-time polymerase chain reaction; Ph = Philadelphia.

# Normal Bcr-Abl Signaling\*

- The kinase domain activates a substrate protein, eg, PI3 kinase, by phosphorylation
- This activated substrate initiates a signaling cascade culminating in cell proliferation and survival

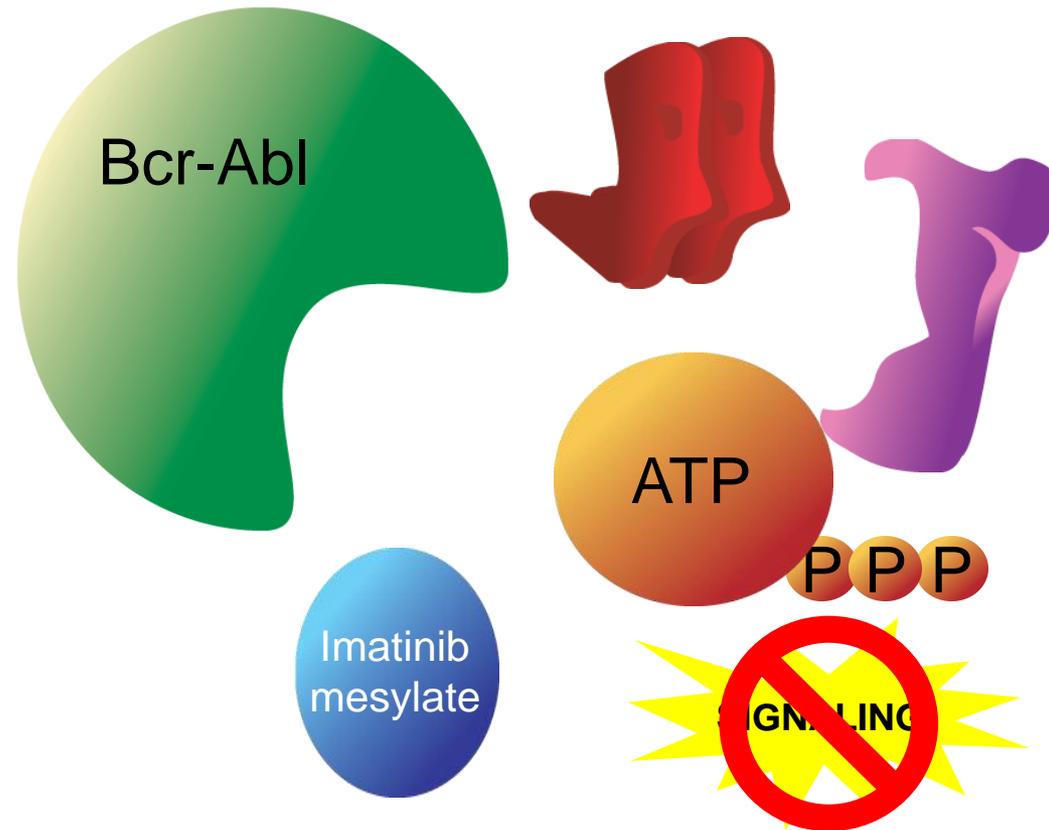

ADP = adenosine diphosphate; ATP = adenosine triphosphate;  
P = phosphate.

Savage and Antman. *N Engl J Med.* 2002;346:683  
Scheijen and Griffin. *Oncogene.* 2002;21:3314.

# Imatinib Mesylate - a BCR-ABL- *selective* inhibitor: Mechanism of Action\*

- Imatinib mesylate occupies the ATP binding pocket of the Abl kinase domain
- This prevents substrate phosphorylation and signaling
- A lack of signaling inhibits proliferation and survival

# Imatinib (Gleevec) - Clinical Efficacy

# TIME

THERE IS NEW **AMMUNITION**  
IN THE WAR AGAINST  
**CANCER.**  
**THESE ARE THE BULLETS.**

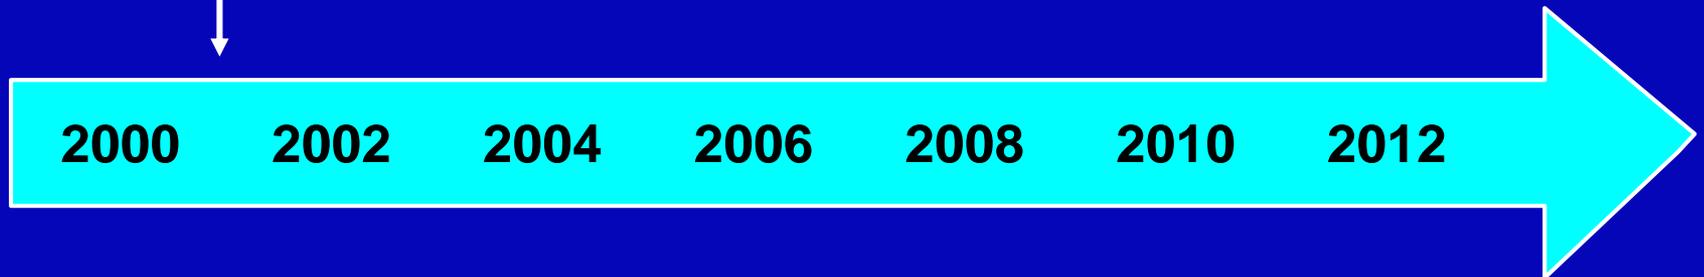

Revolutionary new pills like **GLEEVEC**  
combat cancer by targeting only the  
diseased cells. Is this the breakthrough  
we've been waiting for?

**FDA**  
**Approval,**  
**May 2001**

# Evolving CML Treatment Landscape

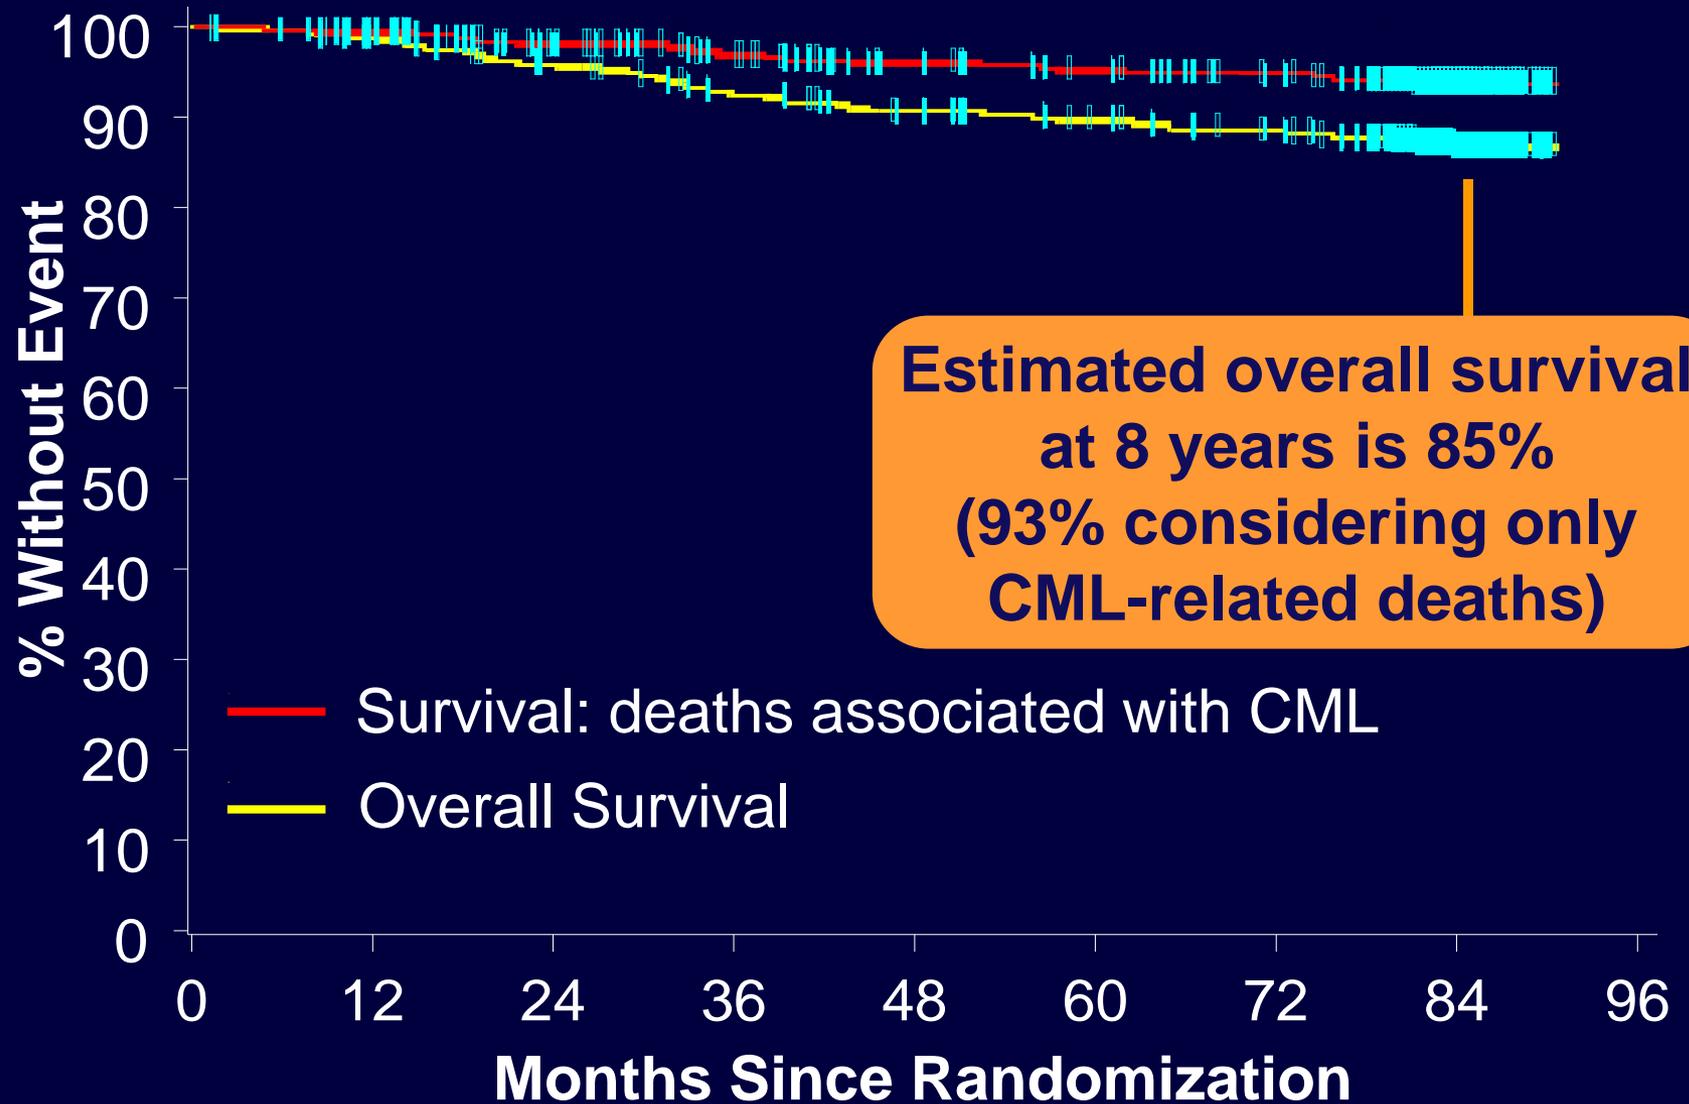

**GLEEVEC® (imatinib)  
approved by FDA<sup>1</sup>**

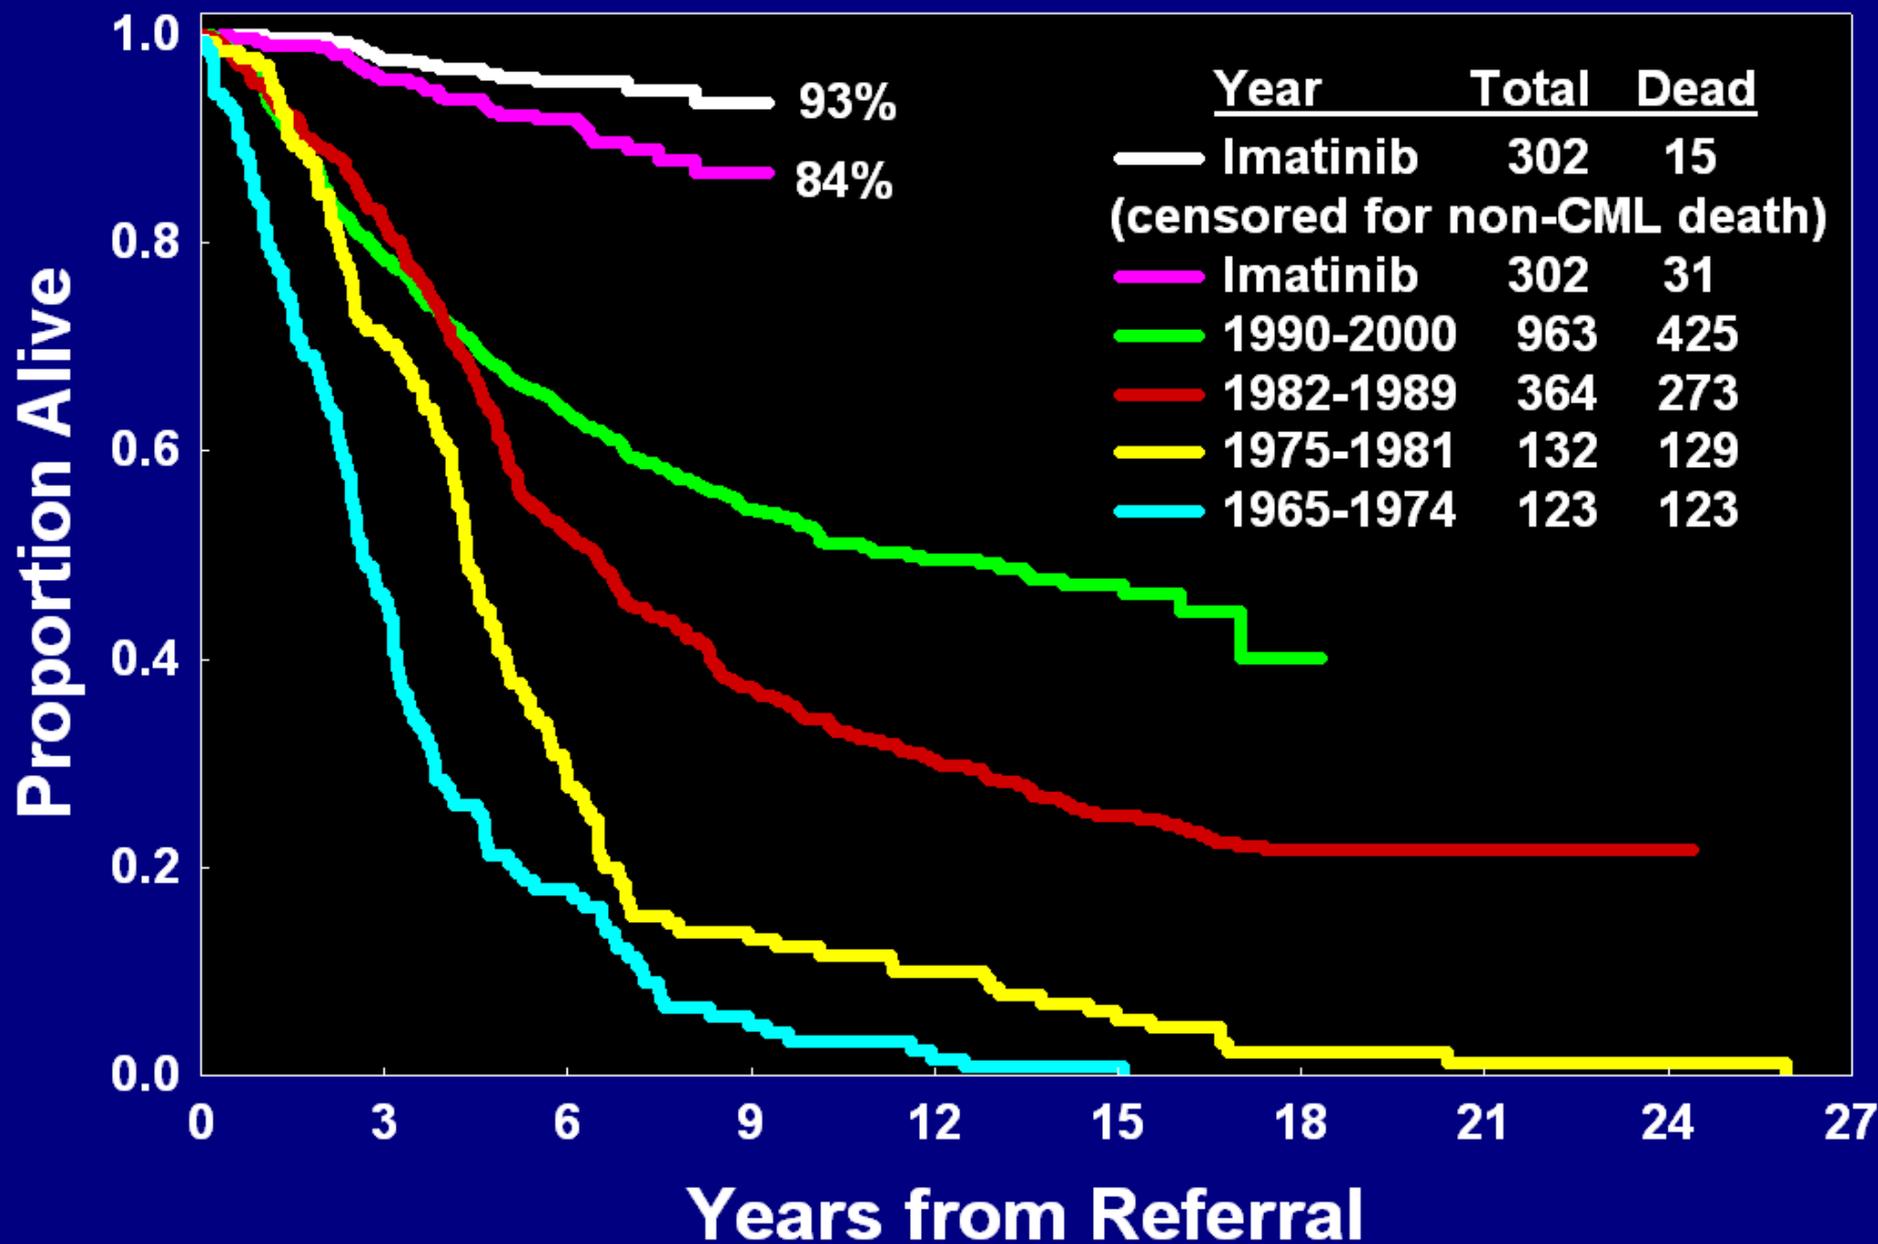

# IMATINIB AS FRONTLINE THERAPY FOR CML

*7-8 year update of newly-diagnosed  
Chronic Phase CML patients treated  
with 400 mg daily imatinib*

# Overall Survival (ITT Principle): Imatinib Arm

# CML Survival at MDACC. 1965-Present ( N=1884)

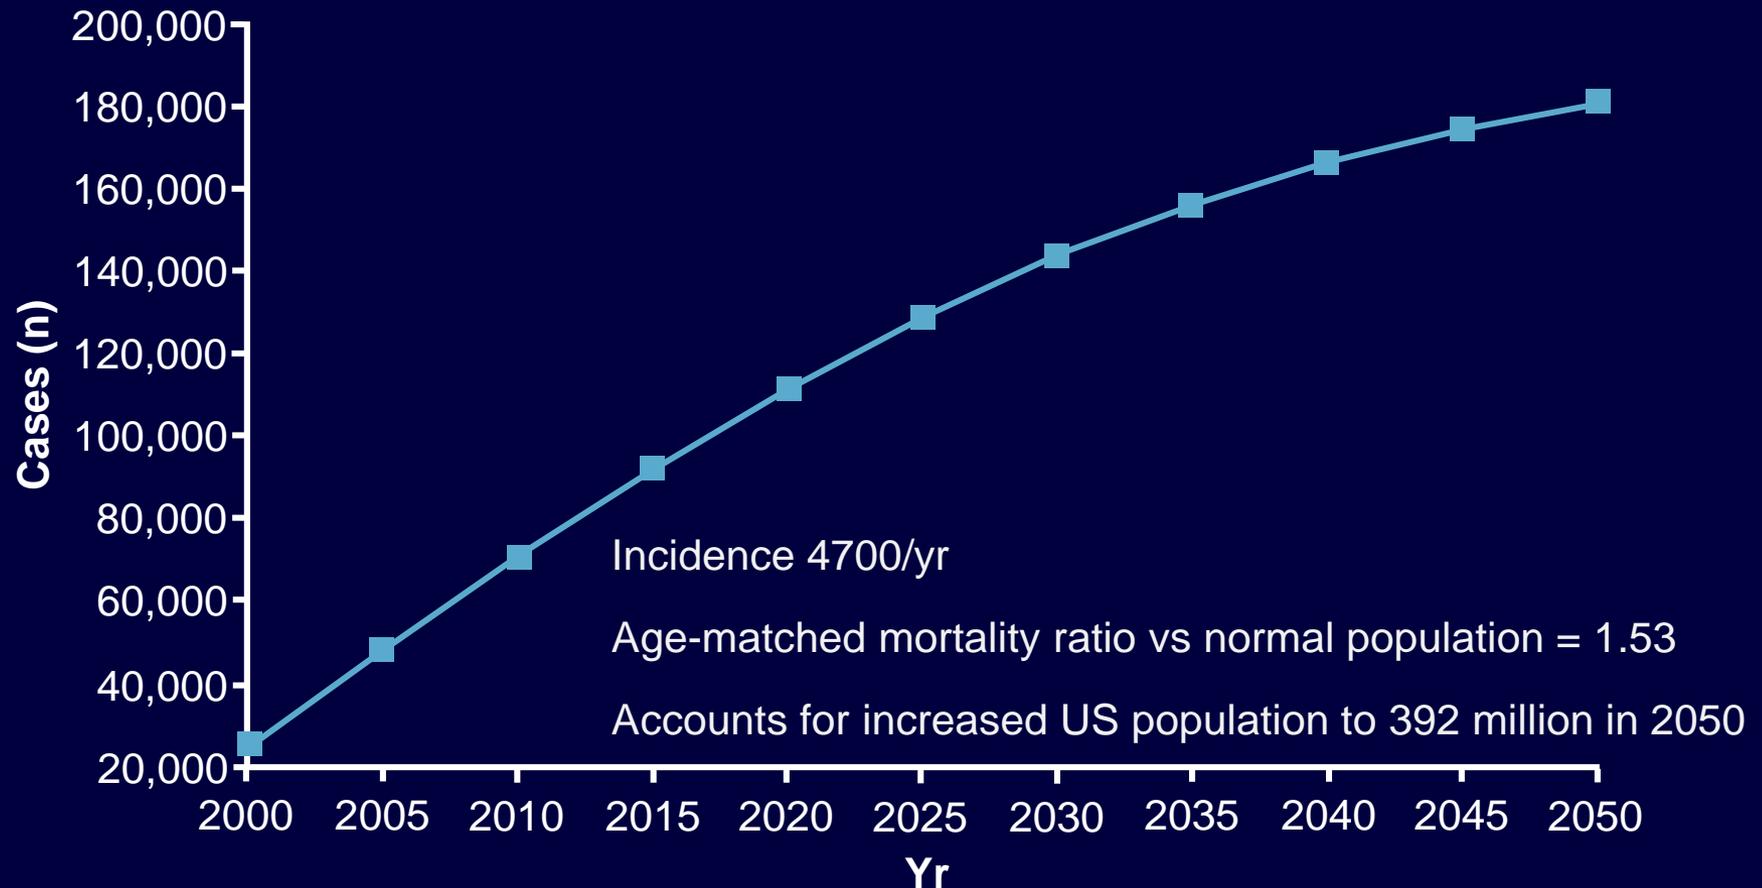

# Incidence And Mortality Of CML

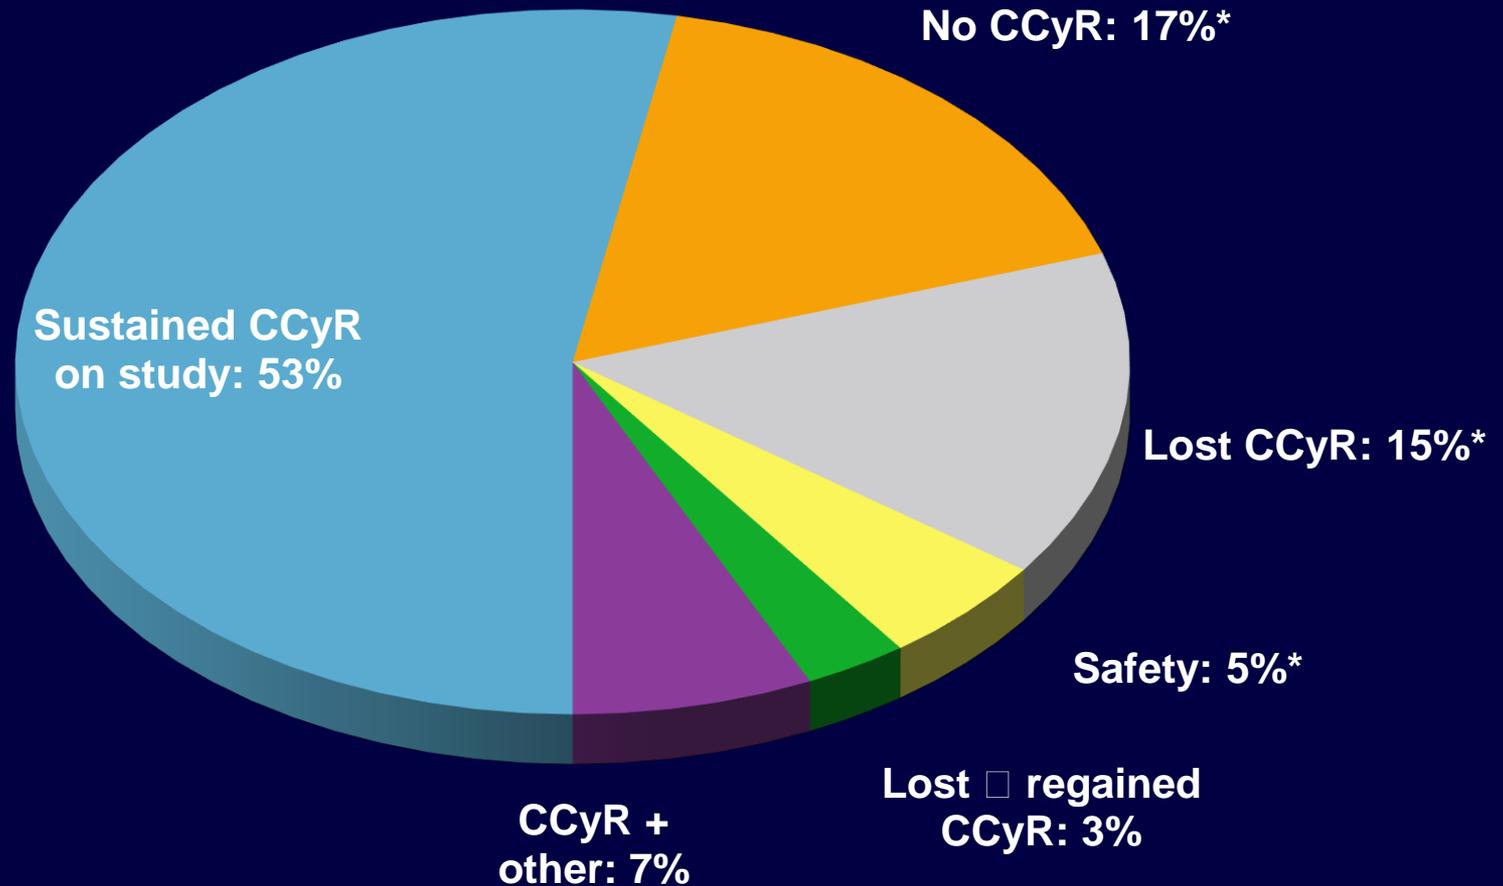

<b>Year</b>	<b>Number of Cases</b>	<b>Number of Deaths (%)</b>
<b>1997</b>	<b>4300</b>	<b>2400</b>
<b>2007</b>	<b>4570</b>	<b>490</b>

Based on current data,  
median survival is expected to exceed 15-20 years.

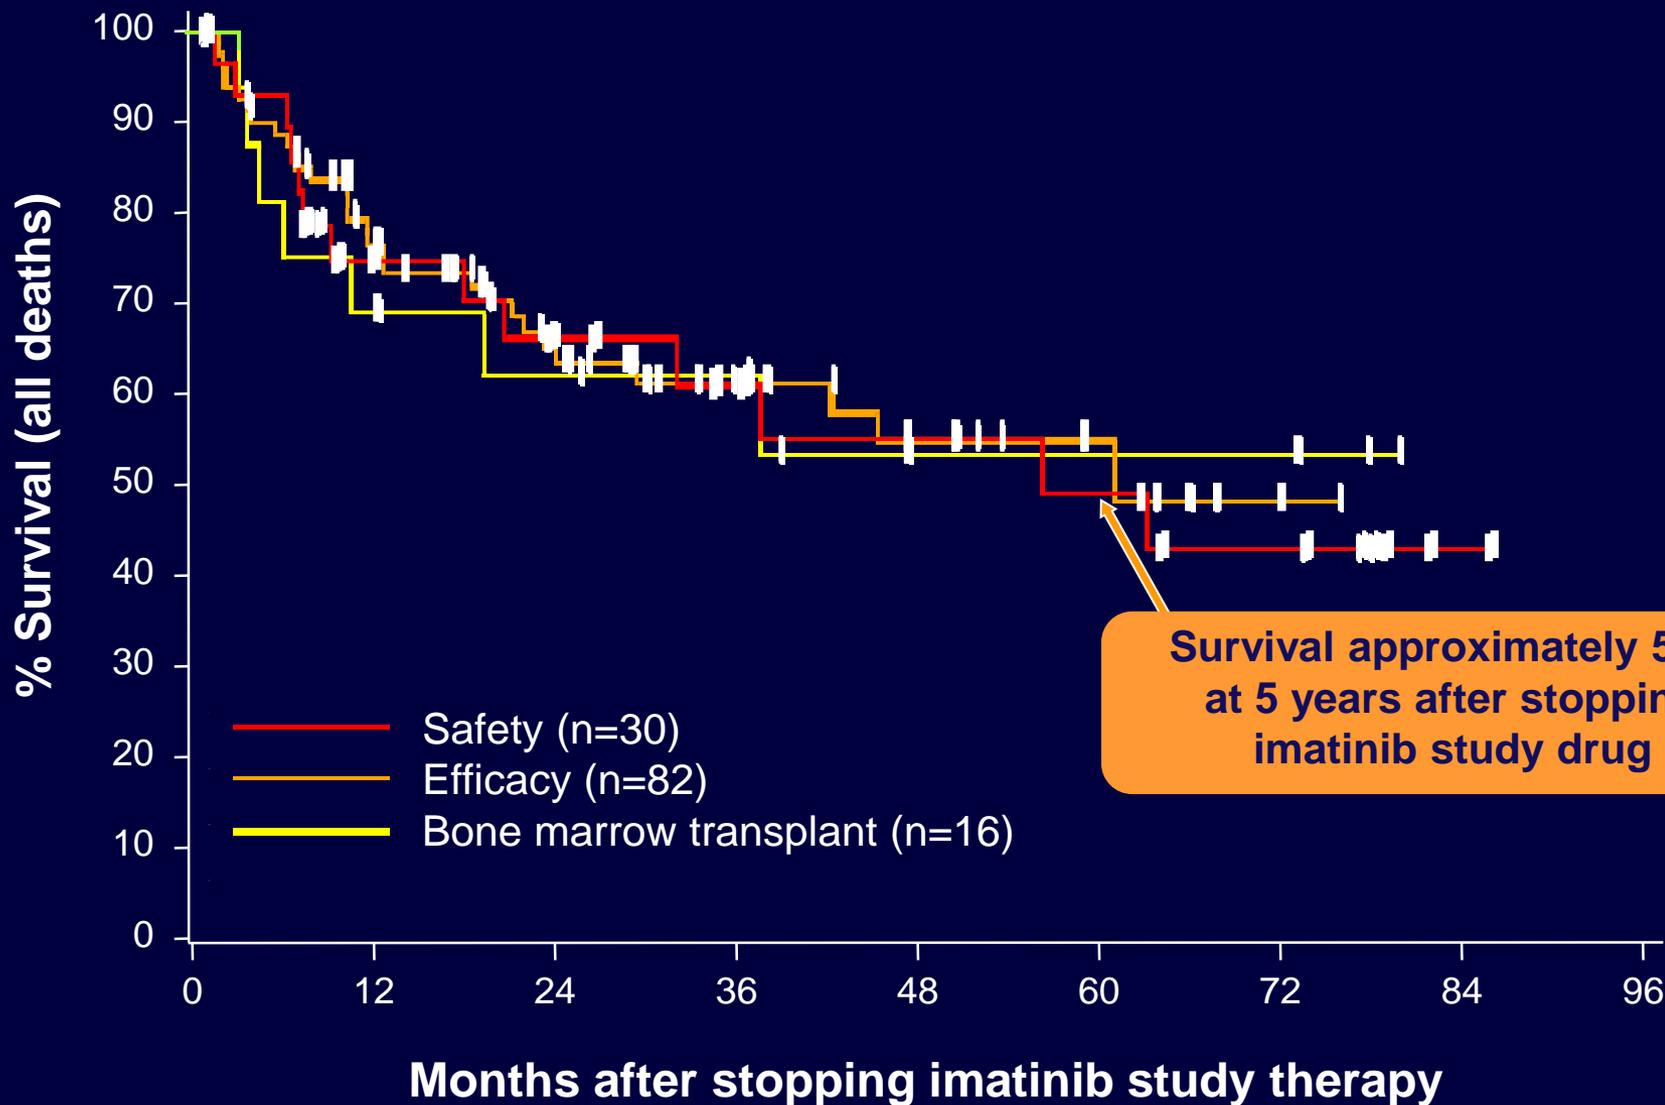

# Estimate of Rapidly Increasing CML Prevalence

# Imatinib: IRIS 8-Yr Update Shows 37% Have Unacceptable Outcome

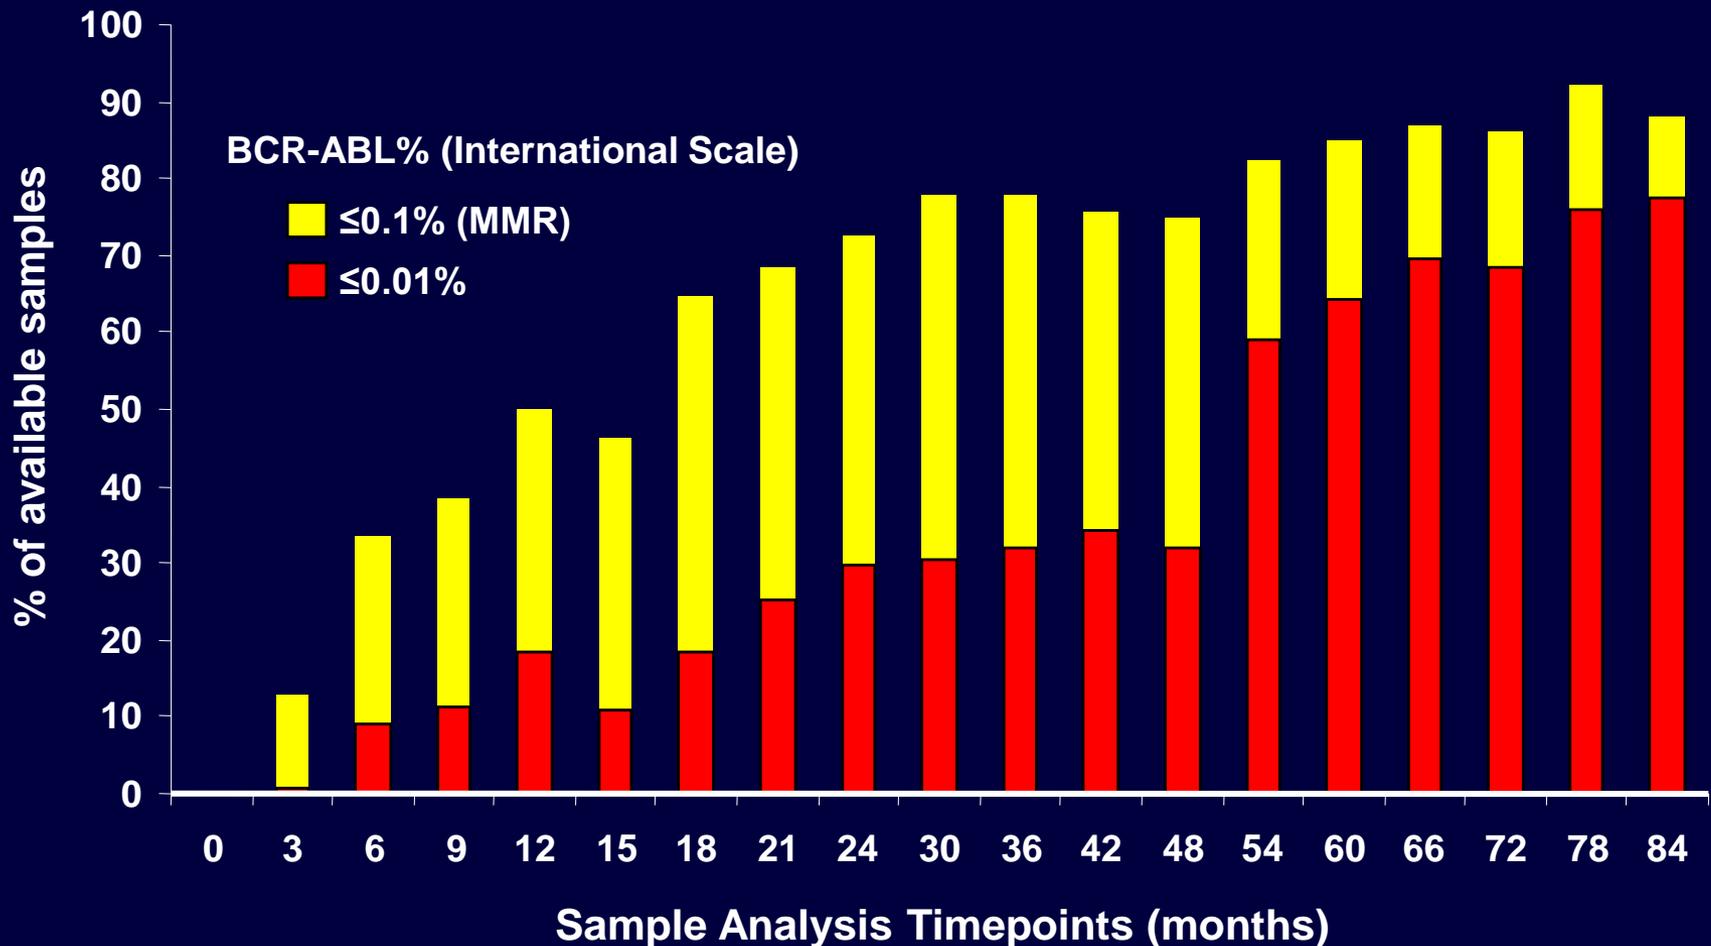

# Survival of Patients Who Discontinued Imatinib Study Therapy

Survival approximately 50% at 5 years after stopping imatinib study drug

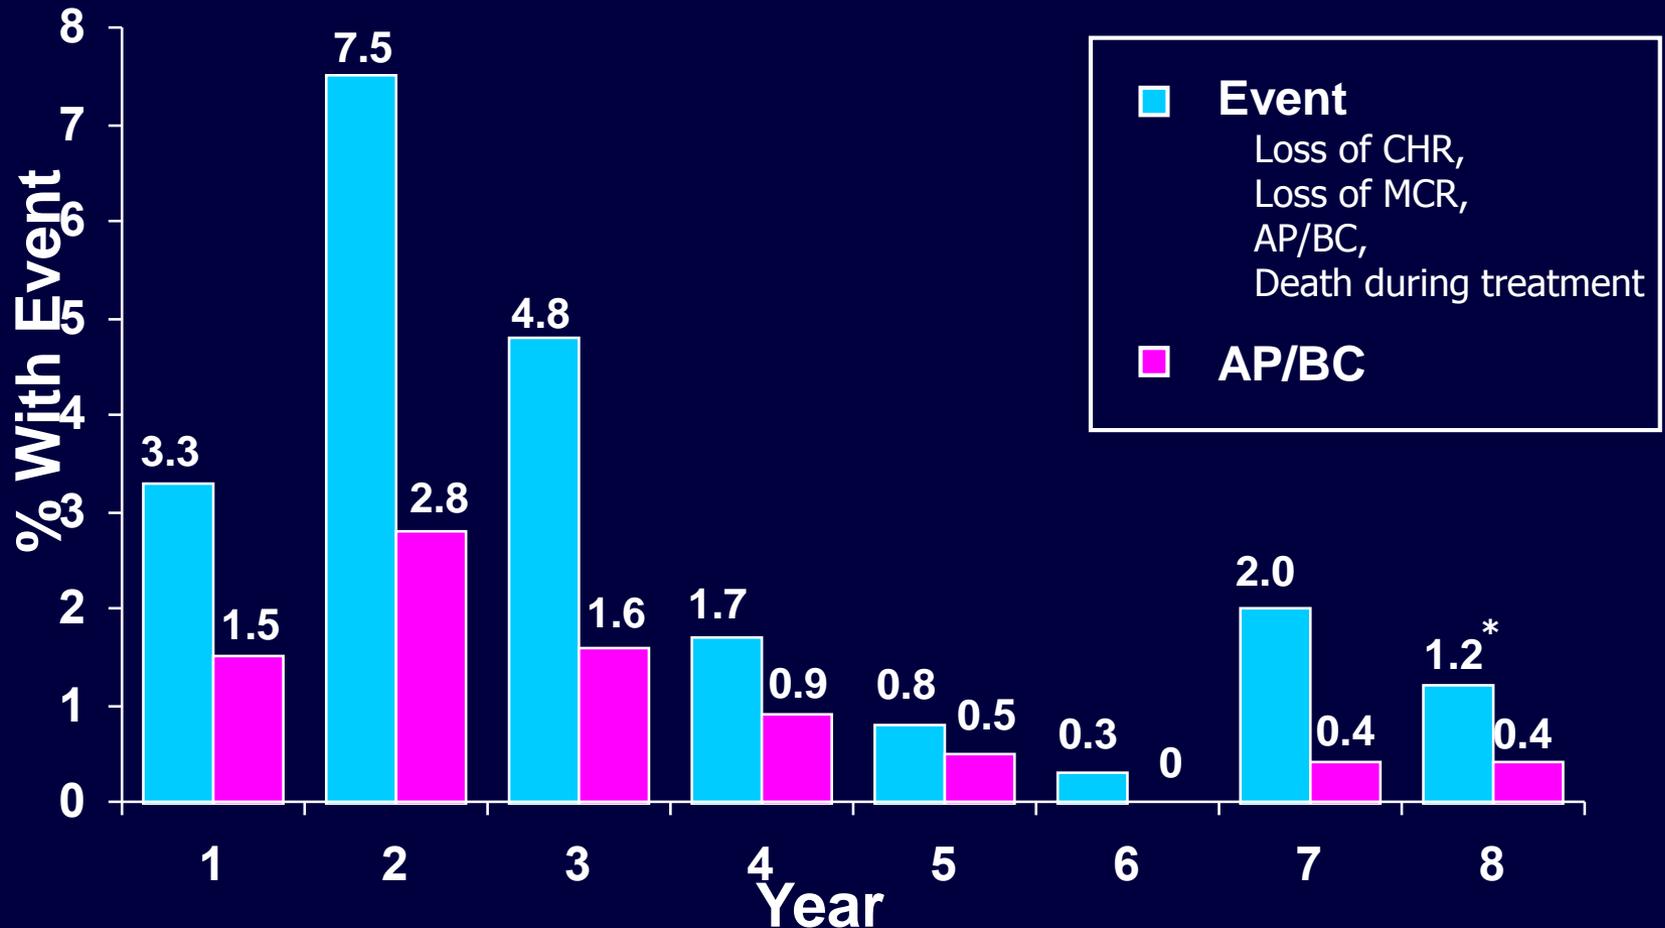

# Molecular Response Rates

- Major molecular response (MMR) and the depth of molecular response increase over time

# Annual Event Rates: Imatinib Arm

- KM estimated EFS at 8 years = 81%
- KM estimated rate without AP/BC at 8 years = 92%

\*Total events (n=3) including two CML-unrelated deaths (n=2), and one patient with progression to AP/BC  
Deininger et al. ASH 2009, Abstract 1126<sup>28</sup>

# Most Frequently Reported AEs: First-Line Imatinib

Most Common Adverse Events (by 5 Years)	All Grade AEs Patients, %	Grade 3/4 AE's Patients %
Superficial Edema	60	2
Nausea	50	1
Muscle cramps	49	2
Musculoskeletal pain	47	5
Diarrhea	45	3
Rash/skin problems	40	3
Fatigue	39	2
Headache	37	<1
Abdominal pain	37	4
Joint pain	31	3

- Only Serious Adverse Events (SAEs) were collected after 2005
- Grade 3/4 adverse events decreased in incidence after years 1-2

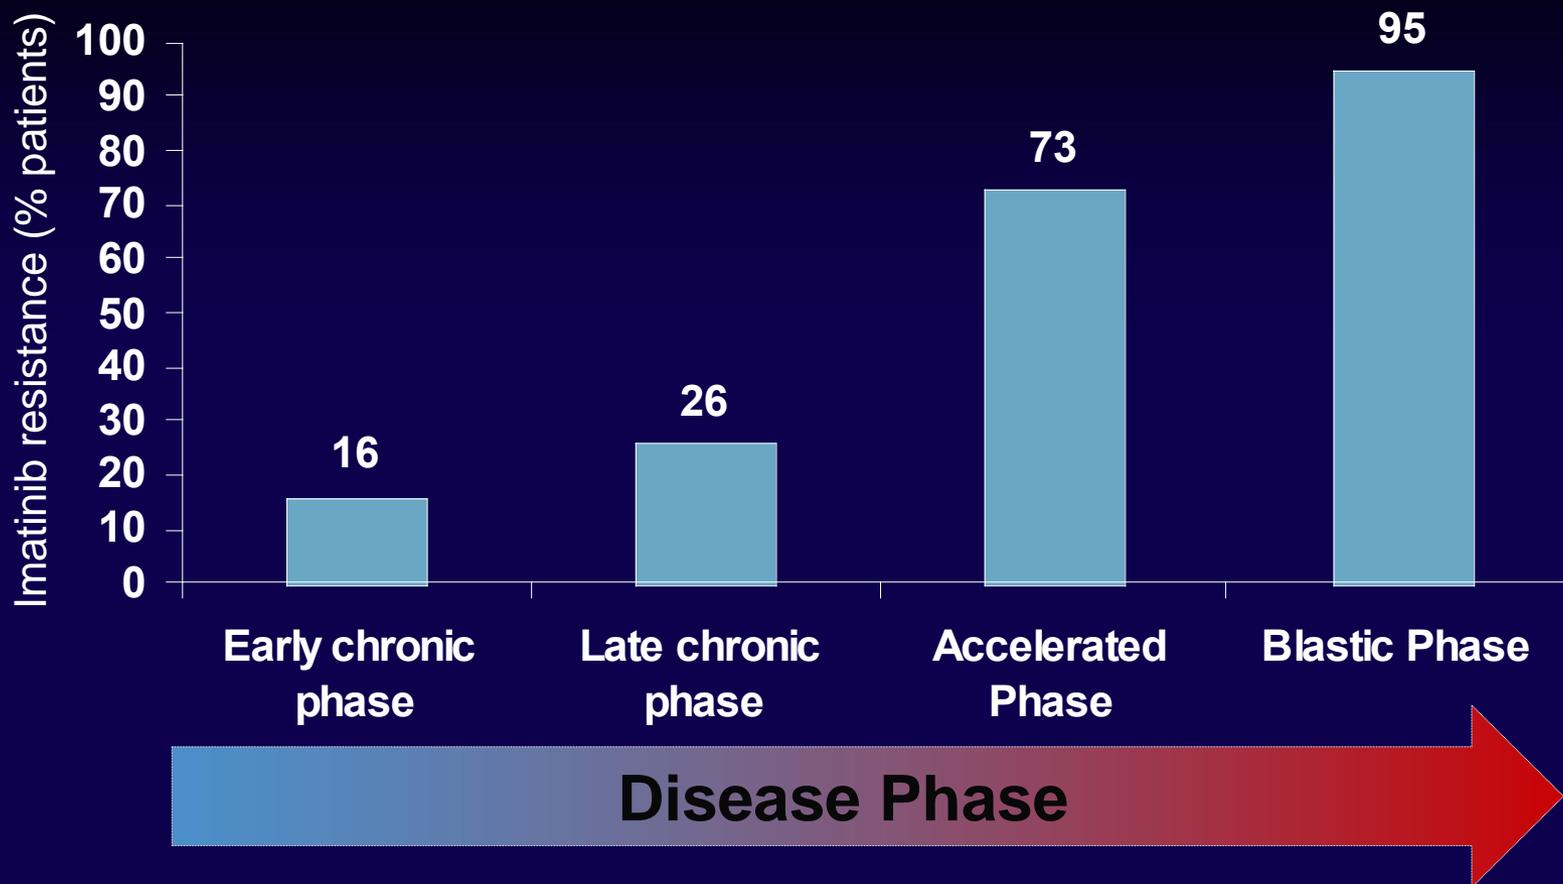

# Imatinib - Conclusions

- Imatinib (400 mg daily) remains the standard dose for chronic phase CML patients
- 85% overall survival with imatinib exceeds that of all other CML therapies, with 7% patients dying from CML after eight years
- 82% of patients treated with imatinib achieved a CCyR
  - 55% of all imatinib randomized patients are still on study treatment, and nearly all of these are in CCyR
- Responses are typically durable, and the annual risk of progression generally decreases with time
- No new safety findings seen with long term follow-up

# IMATINIB-RESISTANT DISEASE

*How is it defined?*

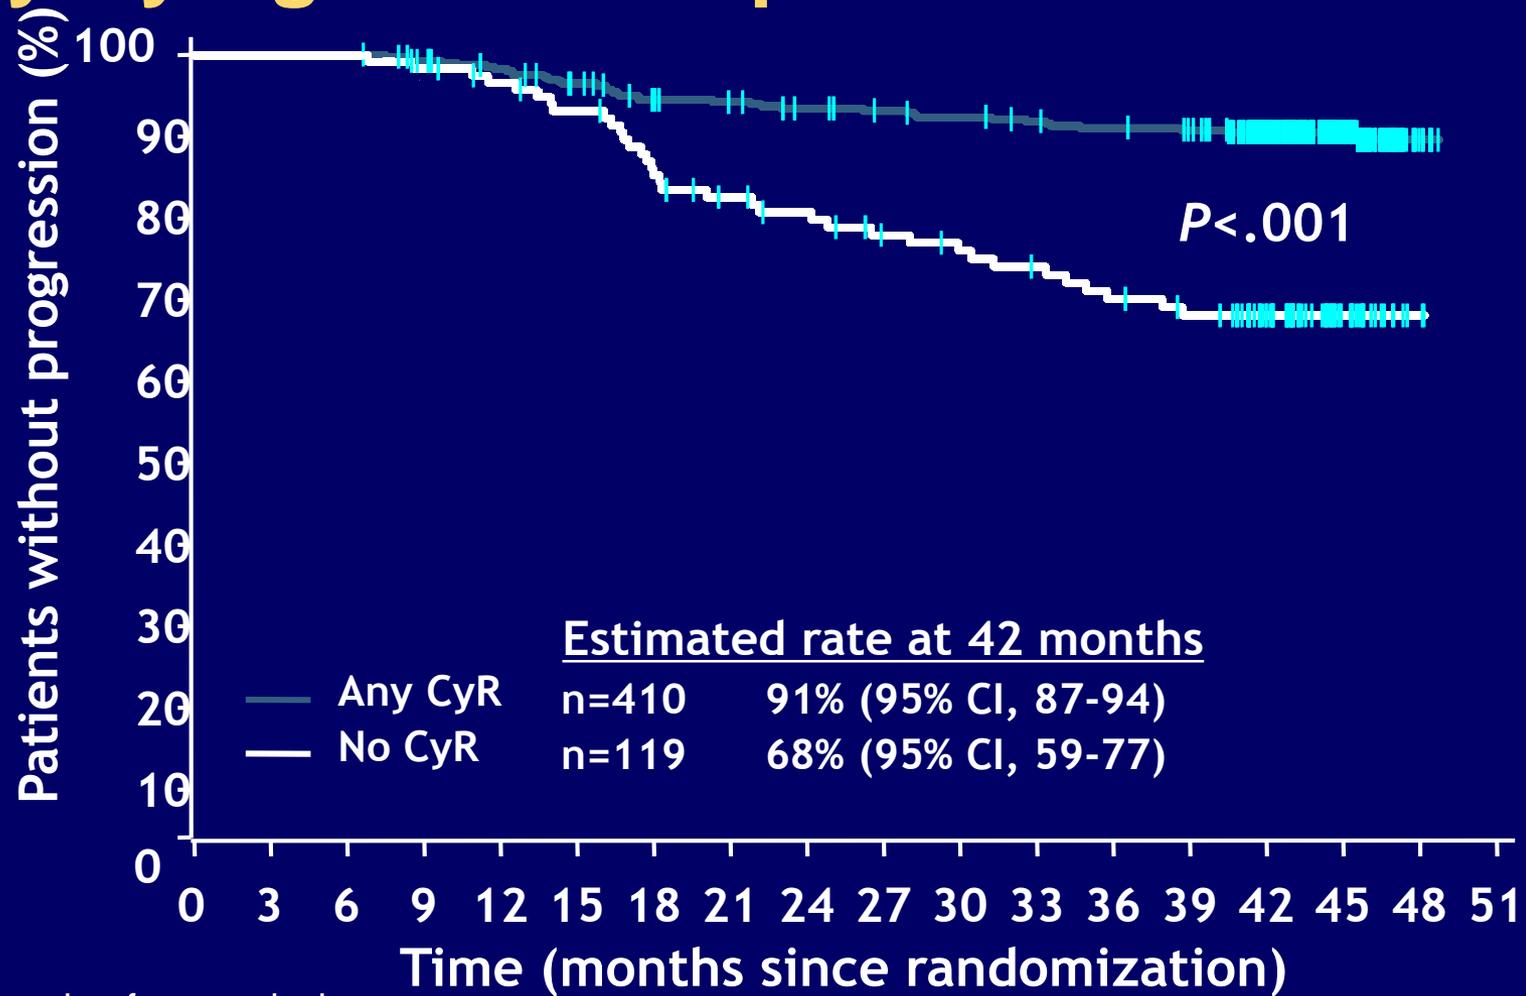

# The Rate of Loss of Response to Imatinib Associated with the Phase of CML

Patients in early CP (disease duration not greater than 6 months) were followed for 42 months. All other patients had been previously treated with interferon and were followed for 48 months.

# RECOGNIZING IMATINIB RESISTANCE

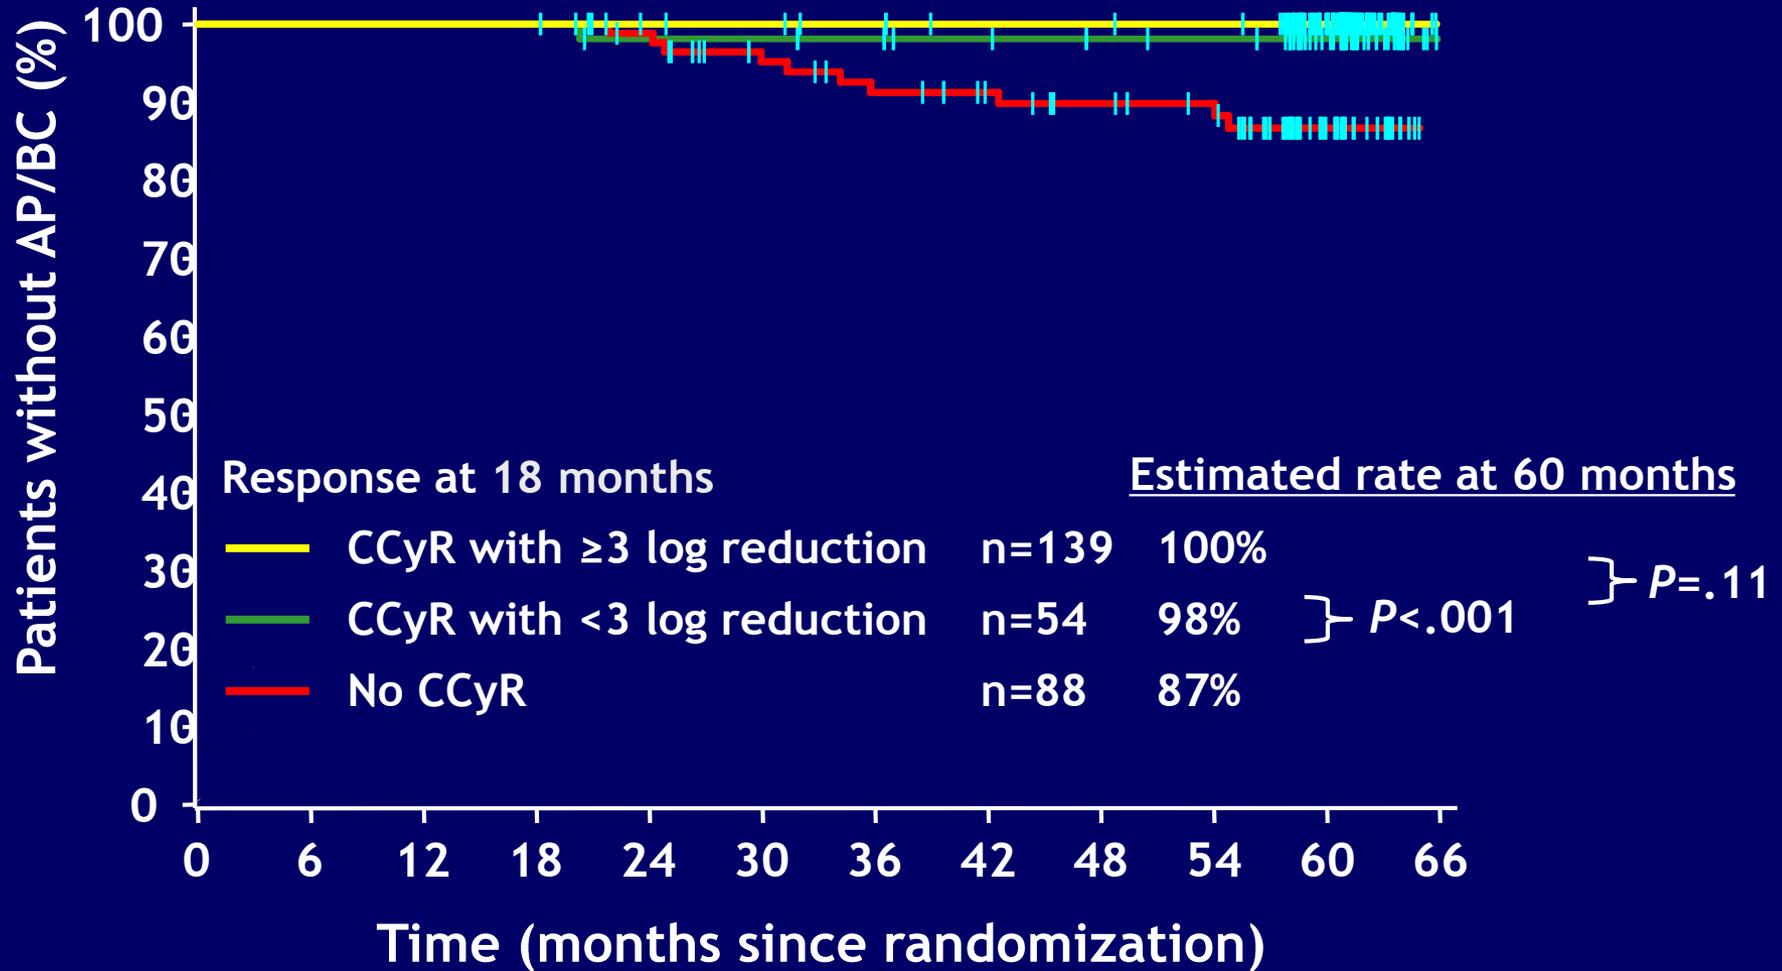

# Progression-free Survival on Imatinib by Cytogenetic Response at 6 Months

PFS=progression-free survival.

Adapted from O'Brien SG et al. *N Engl J Med.* 2003;348:994-1004; Findings noted by Druker B, MD (written communication, January 2007).

# Imatinib Survival Without Accelerated Phase/Blast Crisis by Molecular Response: IRIS Study

# Imatinib Resistance and Intolerance in Chronic Phase CML Definitions

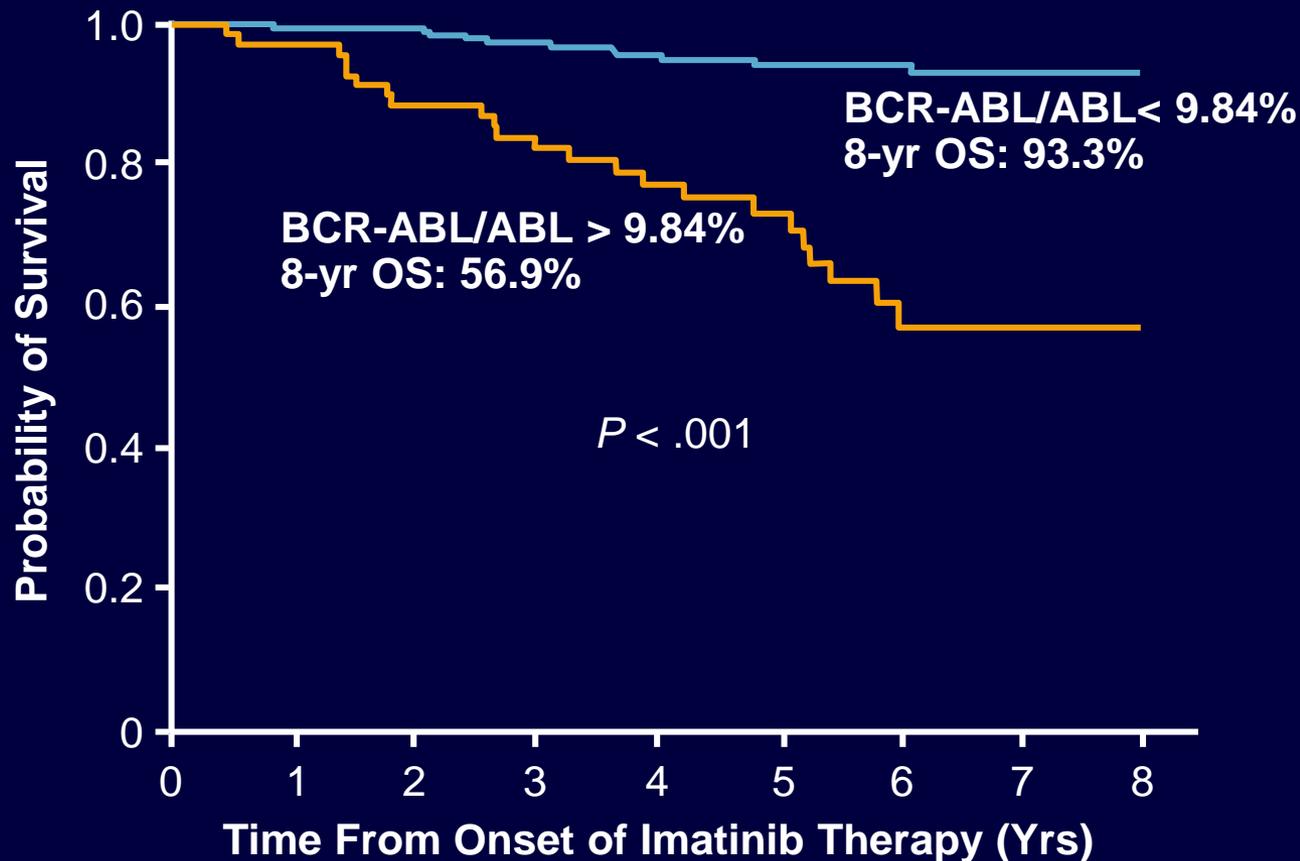

- Resistance can be defined as primary (lack of acceptable initial response) or secondary (loss of an established response)
  - **Primary hematologic resistance** refers to failure to achieve a CHR within 3-6 months of initiating imatinib (~2-4 % of cases\*)
  - **Primary cytogenetic resistance** can be defined as:
    - Lack of any cytogenetic response by 6 months
    - Lack of CCyR by 18 months (~25% of cases\*)
- Secondary resistance refers to progression after an established hematologic or cytogenetic response – increasing worsening cytogenetics/PCR, increasing white blood cell count, or disease transformation to accelerated/blast phase

**\*These categories are NOT mutually exclusive**

# IMATINIB-RESISTANT DISEASE

*Can it be identified earlier than six months, ideally by less invasive methods than bone marrow aspiration?*

# BCR-ABL/ABL after 3 Mos of Imatinib Predicts OS Outcomes (Hammersmith)

# Molecular Response after 3 Months of Imatinib Treatment Correlates with Outcome

- In 282 patients with CP-CML who were treated at the UK Hammersmith hospital, patients with a BCR-ABL transcript level  $>9.84\%$  after three months of imatinib had inferior survival probability at 8 years (56.9 vs 93.3%)<sup>1</sup>
- In 949 CP-CML patients treated with one of four imatinib-containing regimens in Germany, a BCR-ABL level of  $>10\%$  was associated with a higher incidence of treatment failure at 12 months (17.4% vs 2.5%), at 18 months (20.7% vs 5.8%) and disease progression (8.1% vs 2.7%) when compared with patients whose BCR-ABL level was  $<10\%$ <sup>2</sup>, and significantly superior overall survival (95% vs 87%)<sup>3</sup>.

<sup>2</sup>Hehlmann R, et al, ASH 2013 abstract #6510

# Indications for Testing/Monitoring Strategy

## Cytogenetics and PCR

- At diagnosis of CML
  - Baseline cytogenetics and PCR
- While patient is responding
  - BM cytogenetics at 3 and/or 12 mo (and at 18 mo if no CCyR by 12)
  - Blood for PCR for BCR-ABL every 3 mo
- After patient achieves CCyR
  - Blood BCR-ABL PCR every 3 mo, every 3-6 months after three years
  - BM cytogenetics only as clinically indicated
- When BCR-ABL transcripts rises (PCR) by 1 log
  - Evaluate compliance
  - BM cytogenetics and ABL mutation analysis for substantial rise

## ABL Mutation Testing

- Chronic phase
  - Inadequate initial response to treatment
    - No 1-log reduction in PCR or MCyR at 3 mo,
    - No CCyR by 12-18 mo
  - Any loss of response (WBC, cytogenetics, or 1 log increase in PCR)
  - Progression to accelerated or blast phase
- Accelerated and blast phase
  - Any loss of response (WBC, cytogenetics, or PCR)

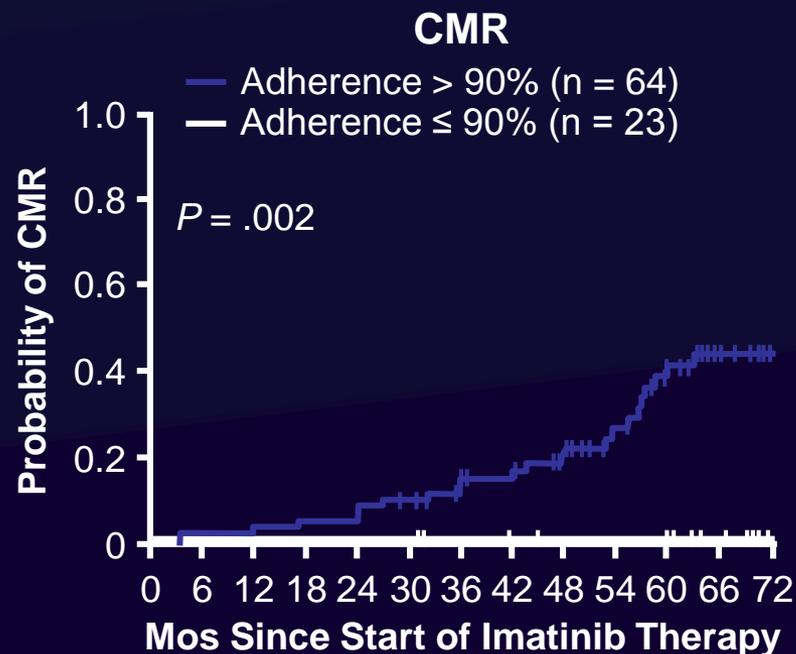

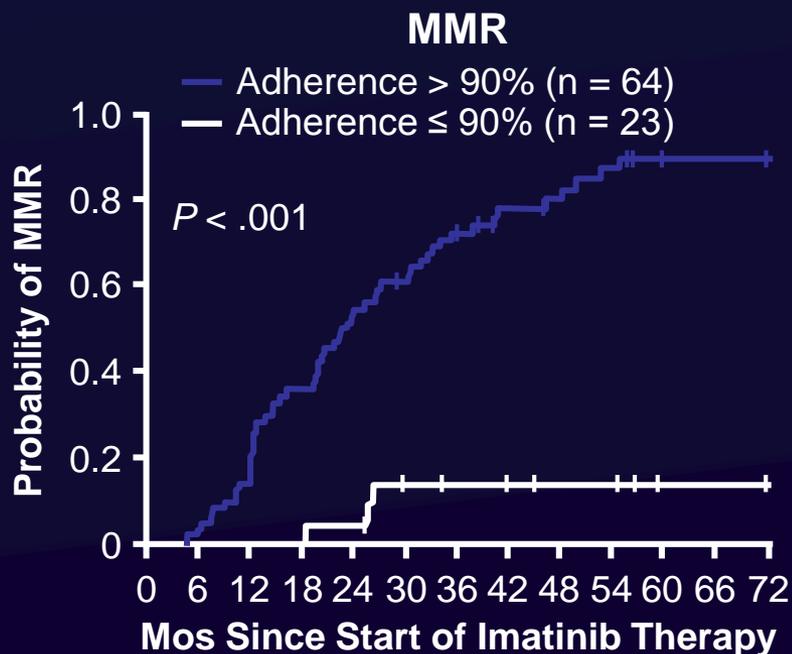

# Defining TKI Failure

Months	NCCN <sup>1</sup> Failure
3	< 1-log PCR reduction or lack of MCyR
12	< MMR or <CCyR
18	< MMR or <CCyR
Anytime	Loss of hematologic response, cytogenetic response or molecular response; progression to accelerated/blast phase CML

CHR, complete hematologic remission; CyR, cytogenetic response; PCyR, partial cytogenetic response; MCyR (0-7/20 Ph+ metaphases), major cytogenetic response; CCyR, complete cytogenetic response (0/20 Ph+ metaphases); MMR, major molecular response (3-log reduction).

# Long-Term Adherence to Imatinib Is Critical for Achieving Molecular Response

- Adherence to imatinib tracked for 3 mos in 87 consecutive CML patients with CCyR using microelectronic monitoring devices

# IMATINIB-RESISTANT DISEASE

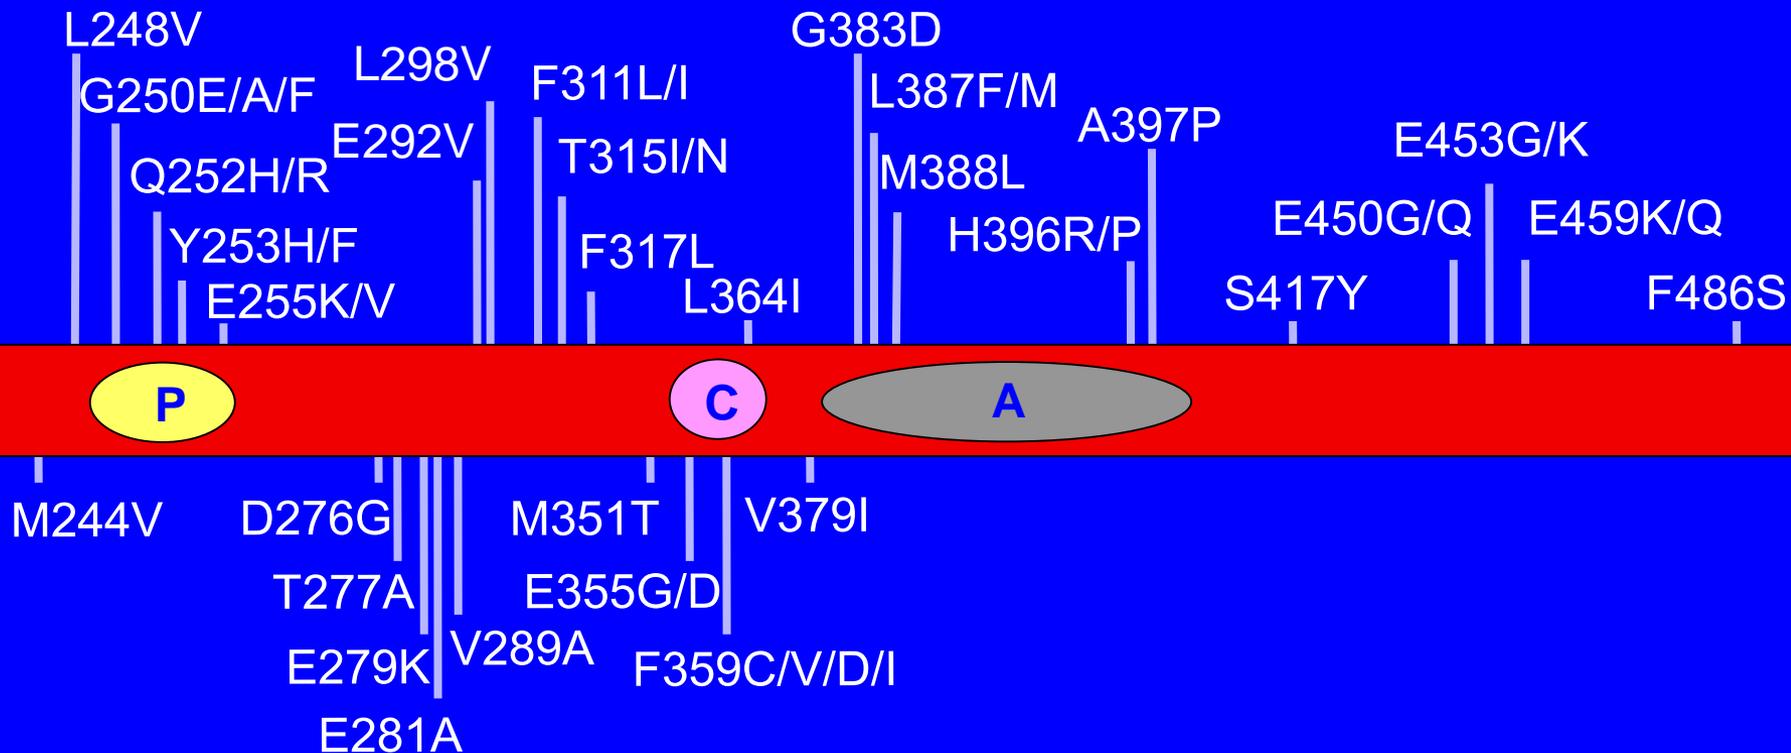

*What are its causes?*

# Clinical Resistance to Imatinib

## Mechanisms

- **Primary resistance**
  - Insufficient inhibition of BCR-ABL
    - Can be due to low plasma levels, activity of drug pumps, etc
  - Individual variation in normal bone marrow reserve (low levels of normal hematopoietic stem cells in some patients)
- **Secondary resistance**
  - Outgrowth of one or more clones harboring an imatinib-resistant BCR-ABL kinase domain mutation (most common)
  - Overproduction of BCR-ABL (e.g. via genomic amplification)
  - BCR-ABL-independent mechanisms (poorly understood)

# (Incomplete) map of *BCR-ABL* kinase domain mutations associated with clinical resistance to imatinib

# Likelihood of Having a Mutation That Confers Cross-resistance to Second-line TKIs

— nilotinib-resistant — dasatinib-resistant

Reprinted from *Experimental Hematology*, Volume 35(4 Supplement 1), Deininger MWN, Optimizing therapy of chronic myeloid leukemia, 144–154, Copyright (2007), with permission from Elsevier.

# Dasatinib and Nilotinib for imatinib-resistant or -intolerant chronic phase CML

- Both drugs are active, and patients with imatinib-resistance or intolerance should be considered for treatment with one of these agents
  - Certain imatinib-resistant mutations may respond preferentially to one of these drugs
    - (F317L --> nilotinib)
    - (Y253H, E255K, E255V, F359C, F359V --> dasatinib)
  - The drugs have somewhat different side effects that can occur
    - Dasatinib: pleural effusion, pulmonary arterial hypertension
    - Nilotinib: QT prolongation, hyperglycemia, pancreatitis, peripheral arterial occlusive events
- Neither drug is active against the BCR-ABL/T315I mutation

# FRONTLINE THERAPY FOR CML

CML patients*

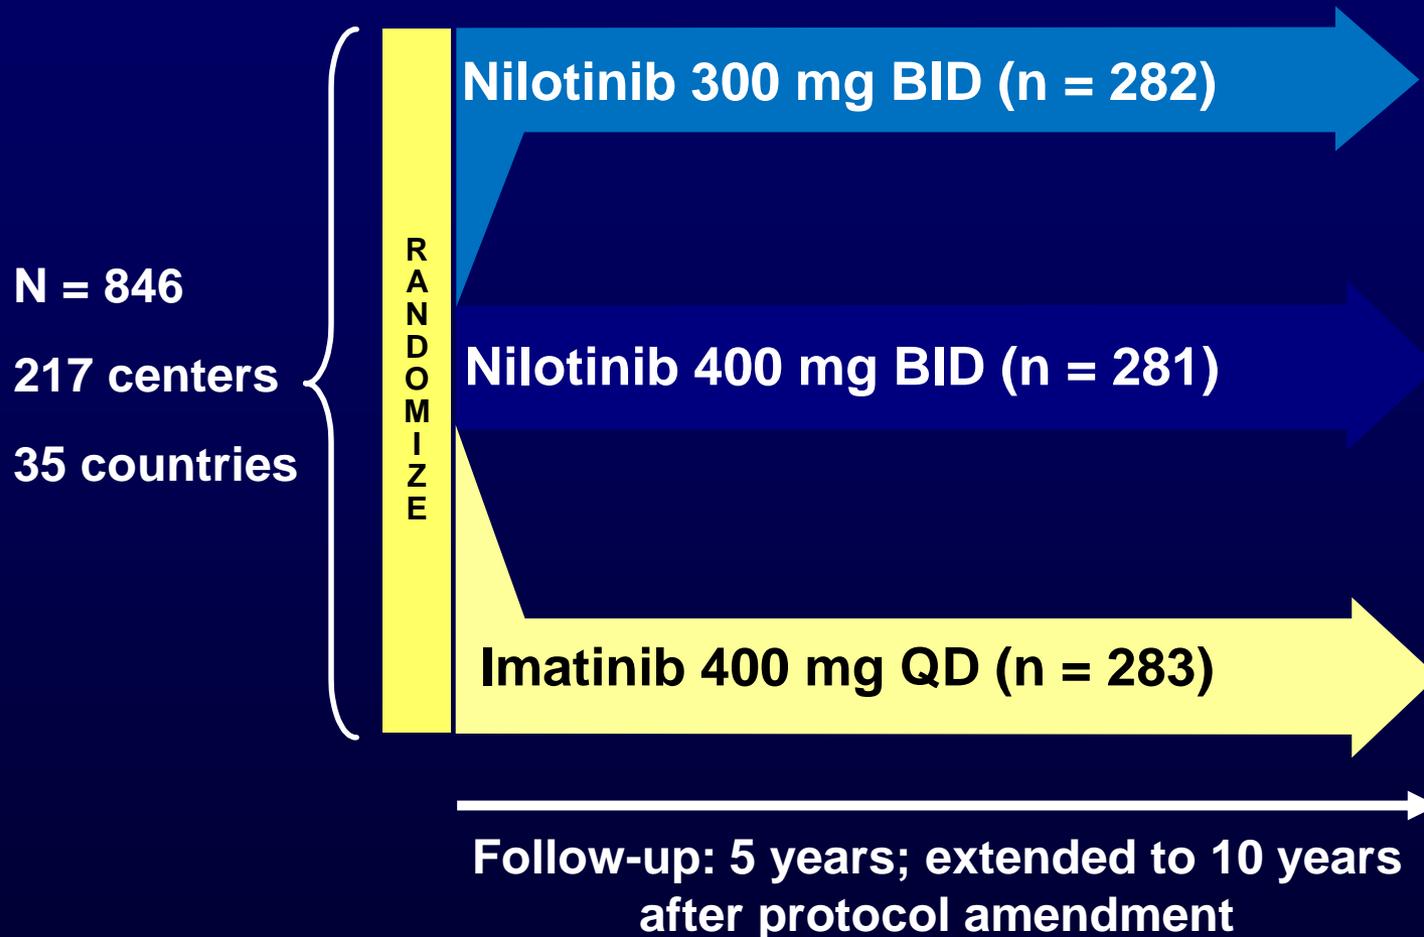

# FRONTLINE THERAPY FOR CML

*What is the potential role of newer agents in the frontline management of CP-CML?*

# **ENESTnd Update: Nilotinib vs Imatinib in Patients With Newly Diagnosed CML-CP and the Impact of Early Molecular Response and Sokal Risk at Diagnosis on Long-Term Outcomes**

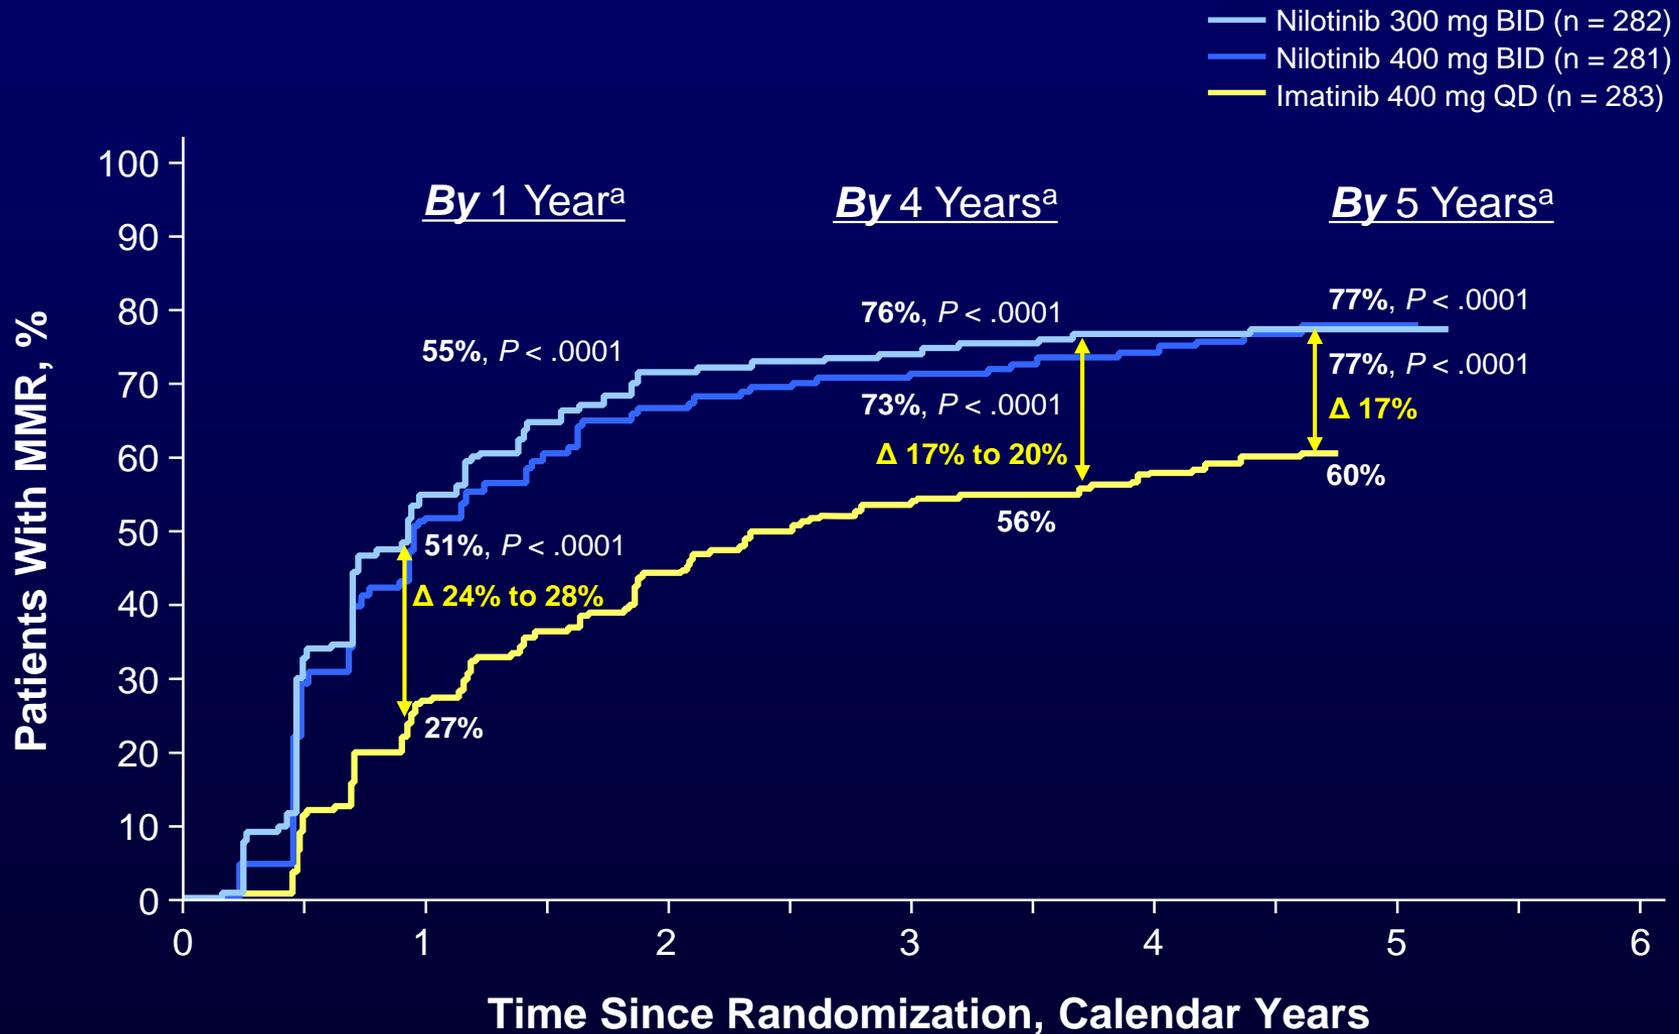

G. Saglio, A. Hochhaus, T. P. Hughes, R. E. Clark, H. Nakamae,  
D.-W. Kim, S. Jootar, G. Etienne, I. W. Flinn, J. H. Lipton,  
R. Pasquini, B. Moiraghi, C. Kemp, X. Fan, H. D. Menssen,  
H. M. Kantarjian, and R. A. Larson,  
on behalf of the ENESTnd Investigators

# ENESTnd Study Design

- Patients were stratified according to Sokal risk score at diagnosis

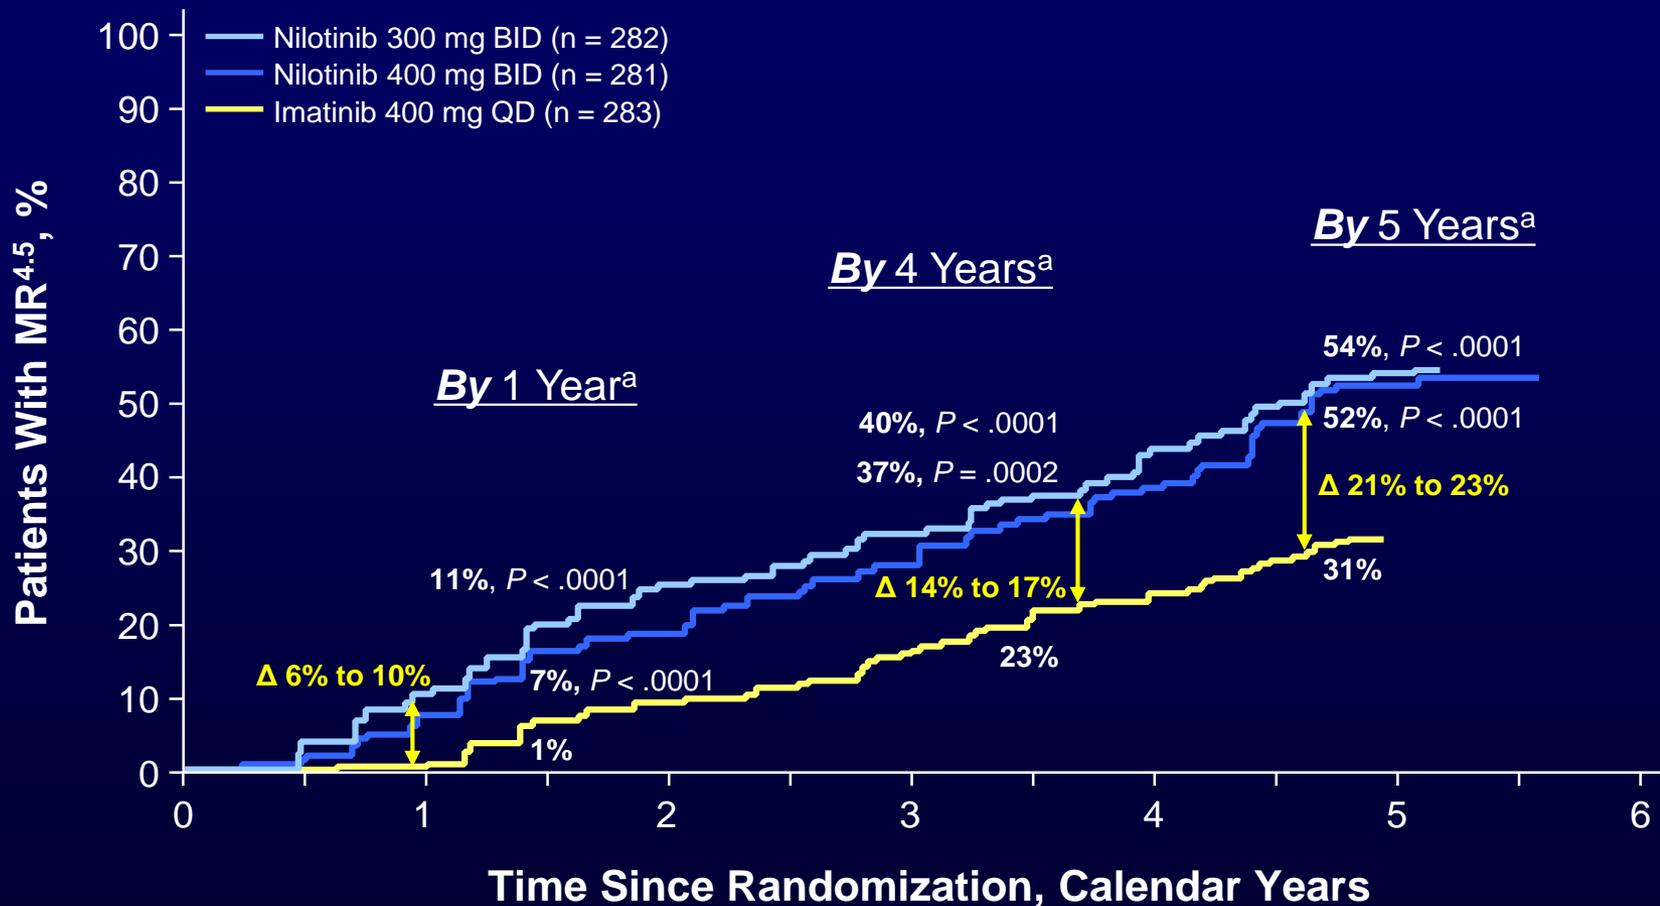

# Cumulative Incidence of MMR

MMR, major molecular response ( $\text{BCR-ABL}^{\text{IS}} \leq 0.1\%$ ).

<sup>a</sup> Cumulative response rates reported consider each year to consist of twelve 28-day cycles.

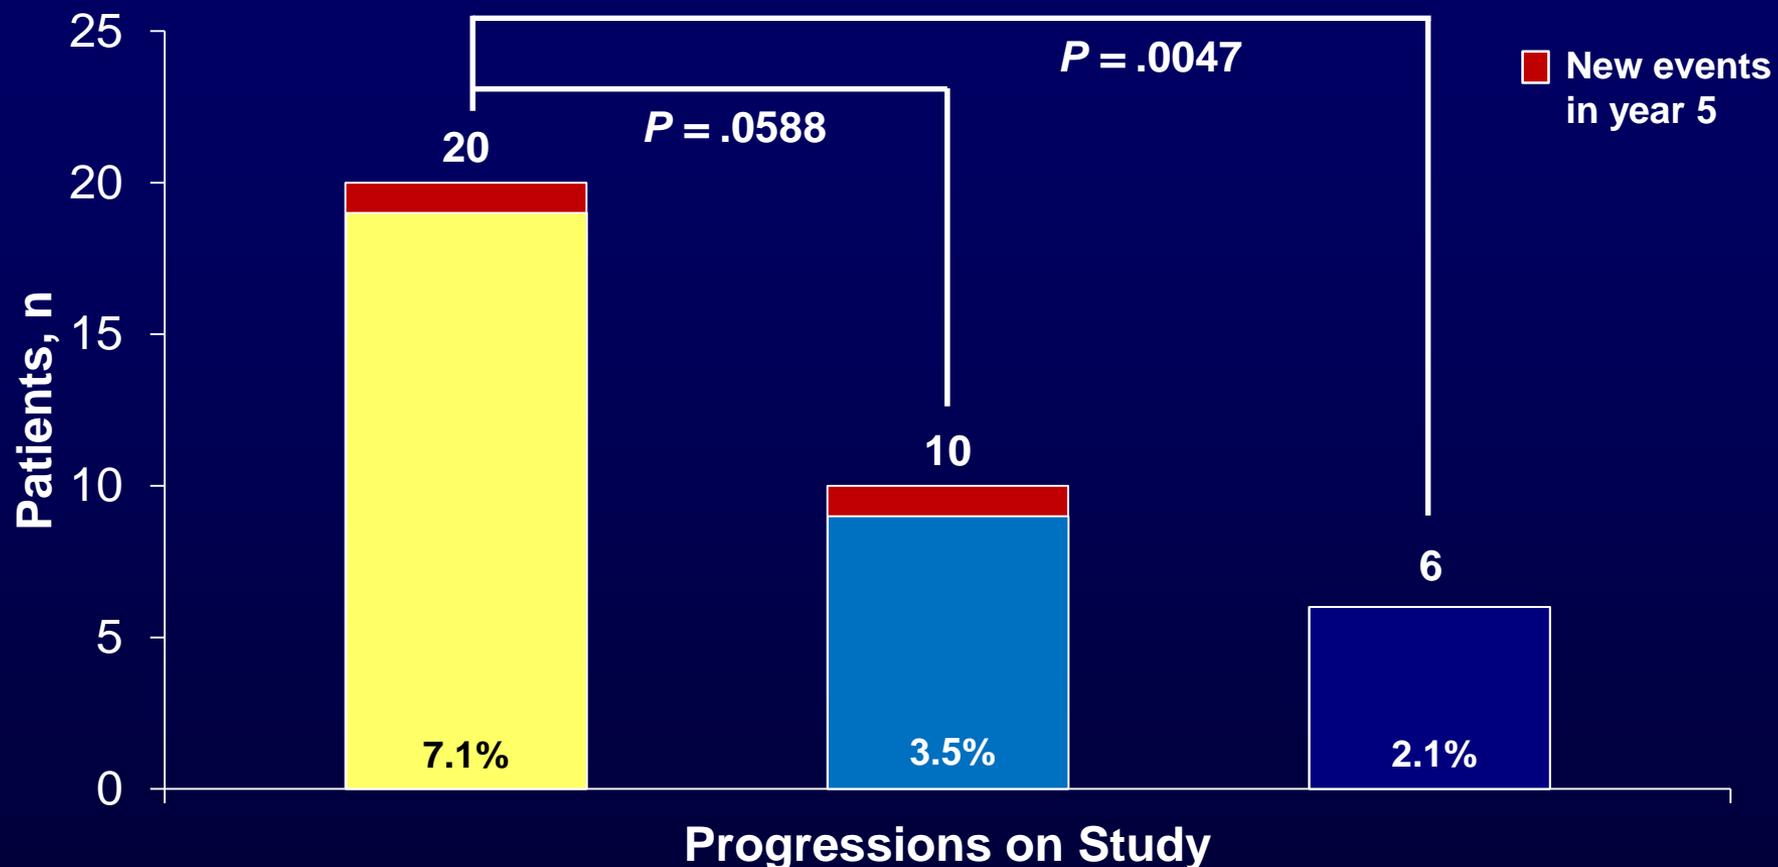

# Cumulative Incidence of MR<sup>4.5</sup>

MR<sup>4.5</sup>, molecular response  $\geq 4.5$ -logs (BCR-ABL<sup>IS</sup>  $\leq 0.0032\%$ ).

<sup>a</sup> Cumulative response rates reported consider each year to consist of twelve 28-day cycles.

# Progression to AP/BC on Study<sup>a</sup> (Including After Treatment Discontinuation)

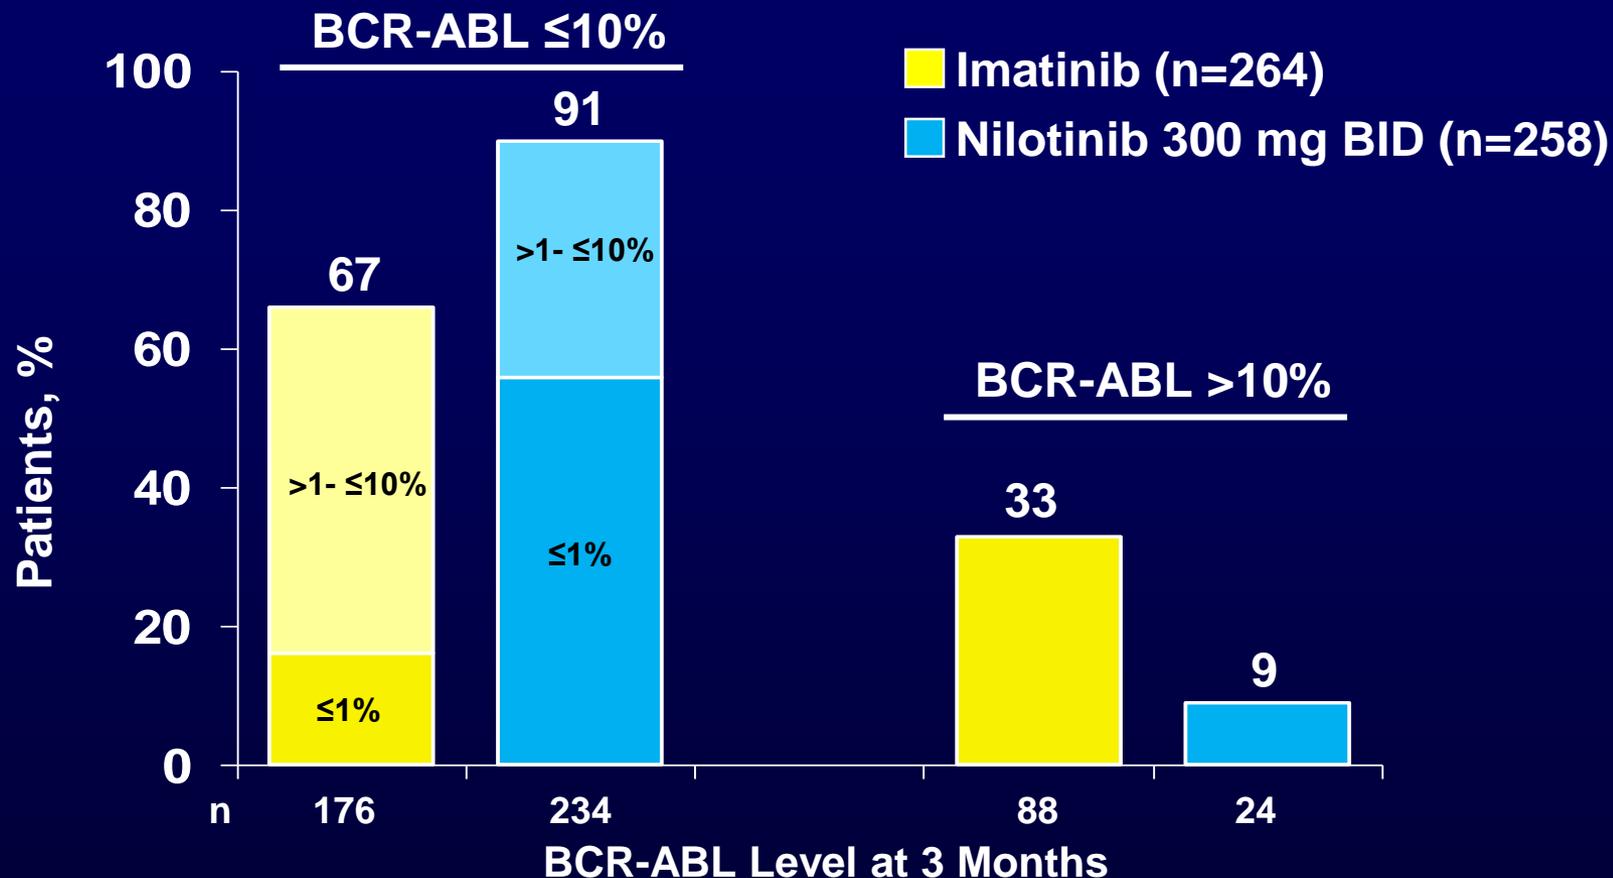

■ Imatinib 400 mg QD (n = 283) ■ Nilotinib 300 mg BID (n = 282) ■ Nilotinib 400 mg BID (n = 281)

- Two new progressions on study in year 5 (1 in the nilotinib 300 mg BID arm and 1 in the imatinib arm)
- Both patients had BCR-ABL > 10% at 3 months

<sup>a</sup> Includes progression to AP/BC (excluding clonal evolution) or deaths in patients with advanced CML occurring on study (on core or extension treatment or during follow-up after treatment discontinuation).

# BCR-ABL Categories at 3 Months\*

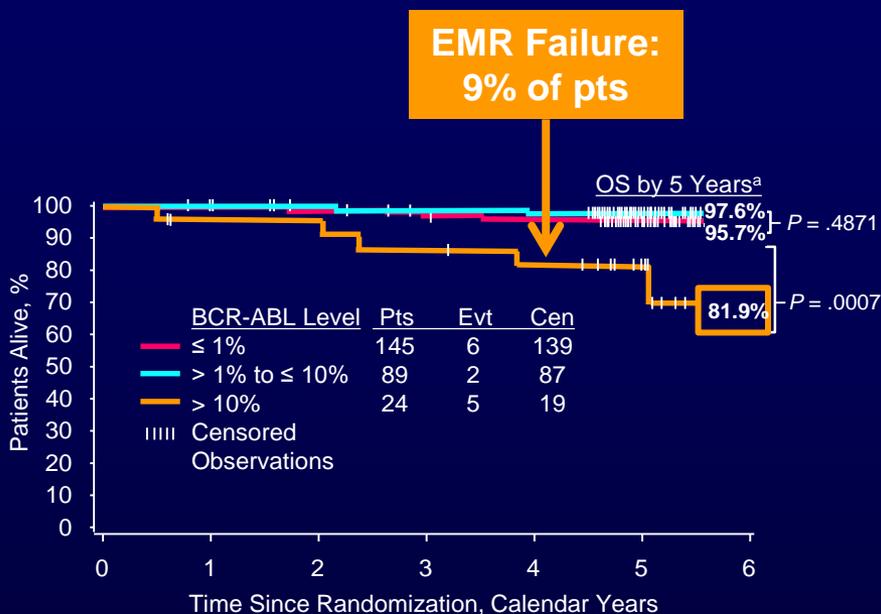

- Reasons for unevaluable samples included:
  - Atypical transcripts: 5 patients on nilotinib, 2 patients on imatinib
  - Missing samples: 4 patients on nilotinib, 5 patients on imatinib
  - Discontinuation: 15 patients (including 1 progression) on nilotinib, 12 patients (including 1 progression) on imatinib

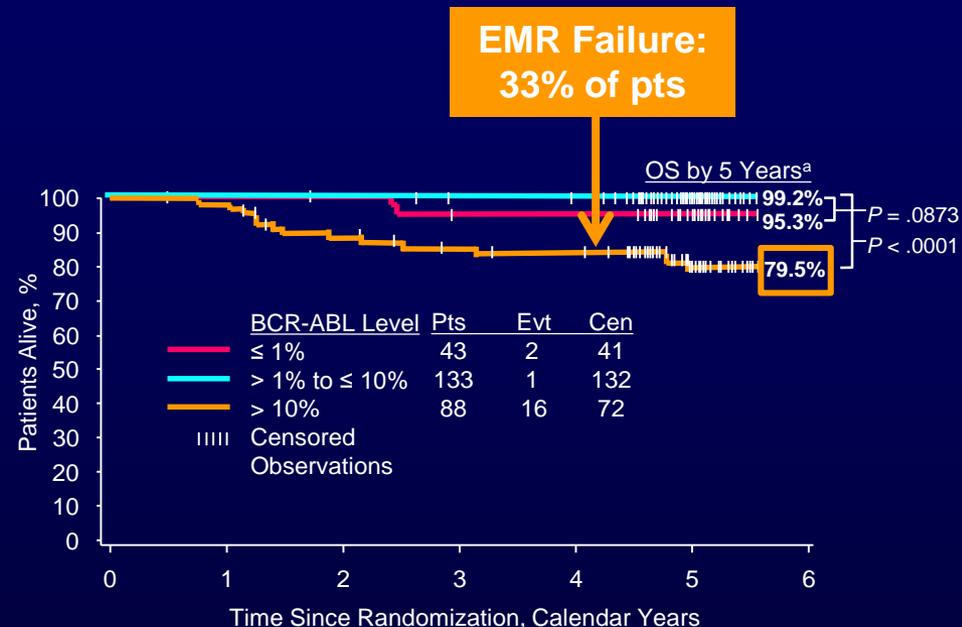

\*Calculated from total number of evaluable patients with PCR assessments at 3 months.

# OS by BCR-ABL Levels at 3 Months

## Nilotinib 300 mg BID

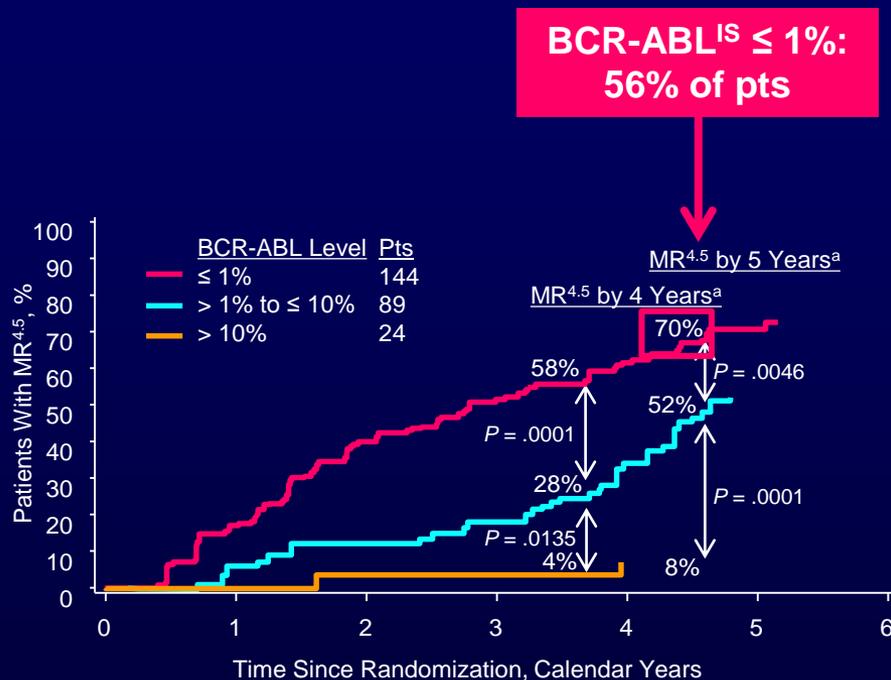

## Imatinib 400 mg QD

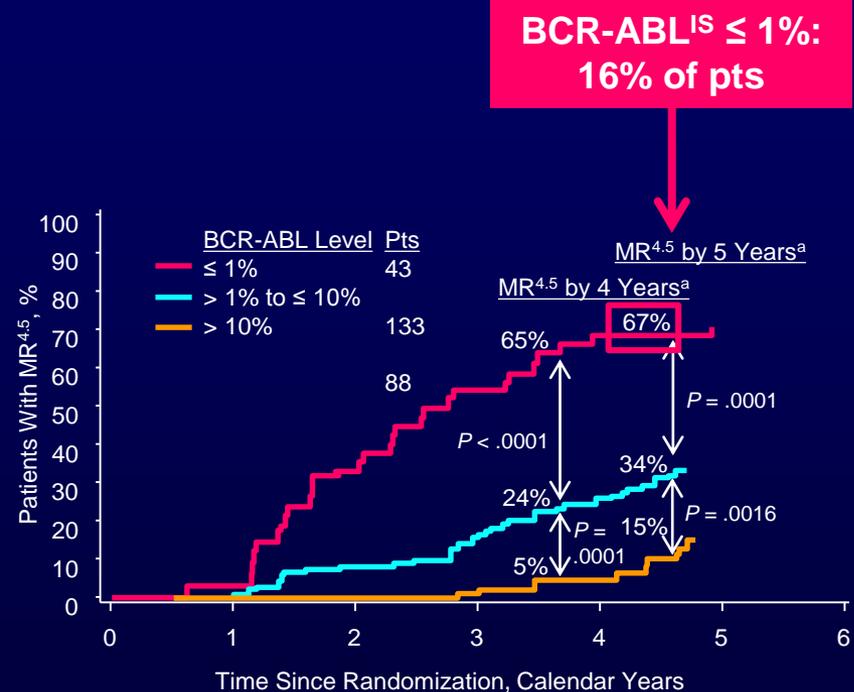

- Patients with EMR failure (BCR-ABL > 10% at 3 months) have significantly worse 5-year OS
- Rates of EMR failure are lower on nilotinib 300 mg BID vs imatinib

# Proportion of Patients With MR<sup>4.5</sup> by BCR-ABL Levels at 3 Months

## Nilotinib 300 mg BID

## Imatinib 400 mg QD

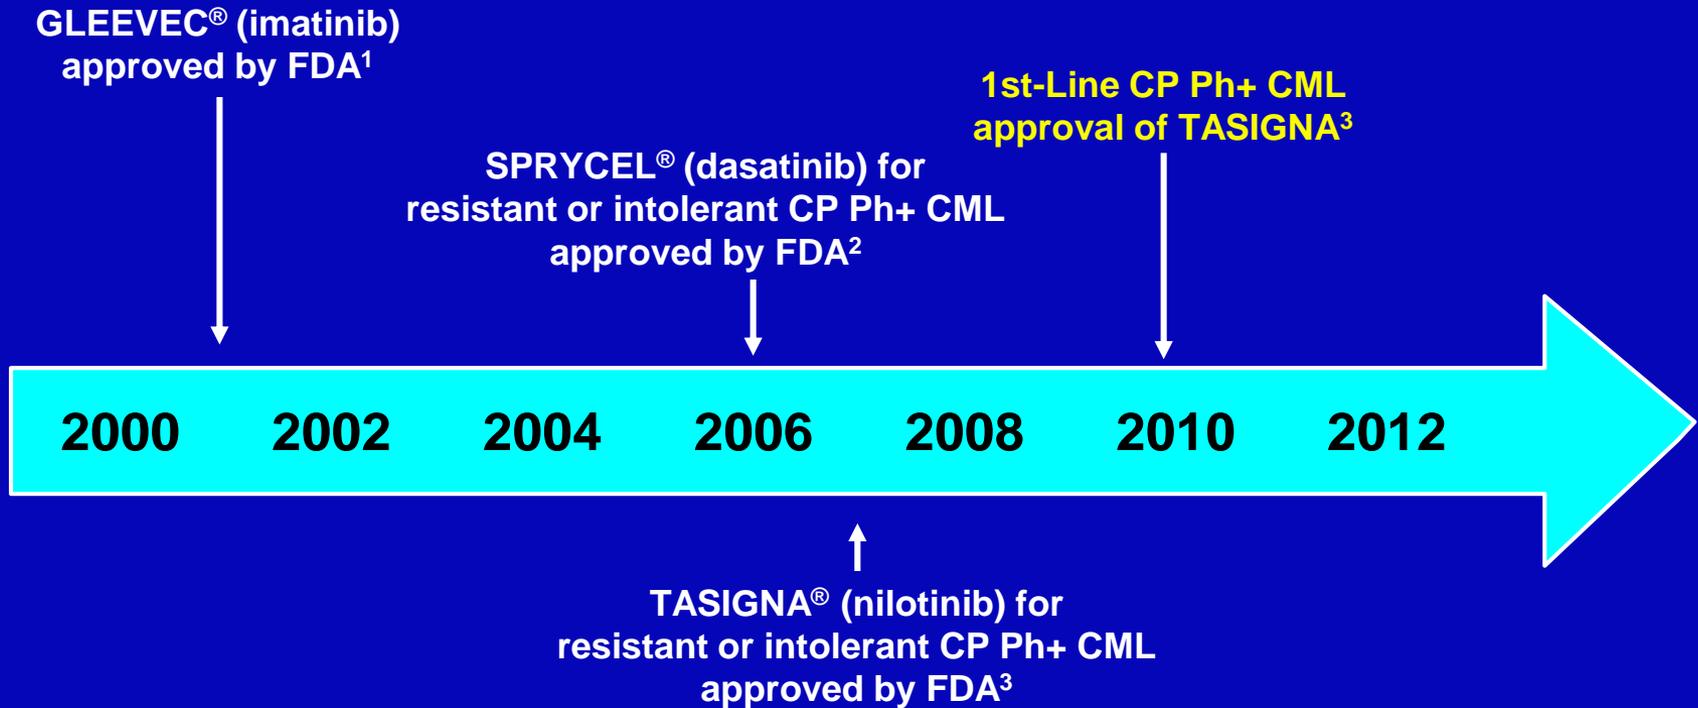

- Patients with BCR-ABL ≤ 1% at 3 months have significantly higher rates of MR<sup>4.5</sup> by 5 years
- More patients achieve BCR-ABL ≤ 1% at 3 months on nilotinib 300 mg BID vs imatinib

<sup>a</sup> Cumulative response rates reported consider each year to consist of twelve 28-day cycles.

# Conclusions

- At 5 years of follow-up, rates of event-free survival, progression-free survival, and overall survival were higher in patients treated with nilotinib than imatinib
- Nilotinib demonstrated higher rates of early and deeper molecular response, including MR<sup>4.5</sup>, and a reduced risk of progression
- By 5 years, more than half of nilotinib-treated patients had achieved MR<sup>4.5</sup>, a key eligibility criterion for many treatment-free remission studies
- Side effects that appear unique to nilotinib include pancreatitis, hyperglycemia, EKG changes and peripheral arterial occlusive events.

On-study treatment and in follow-up after discontinuation of randomized treatment.  
TFS, transformation-free survival.

# Transformation to AP/BP CML by 5 Years

## Overall transformations to AP/BP

■ On study   
 ■ During follow-up beyond discontinuation

	Dasatinib 100 mg QD (n=259)		Imatinib 400 mg QD (n=260)	
	≤10% n=198	>10% n=37	≤10% n=154	>10% n=85
<b>BCR-ABL at 3 Months <sup>a</sup></b>				
<b>Transformation to AP/BP <sup>b</sup>, n (%)</b>	<b>6 (3)</b>	<b>5 (14)</b>	<b>5 (3)</b>	<b>13 (15)</b>

■ One imatinib patient and no dasatinib patients transformed between 4 and 5 years

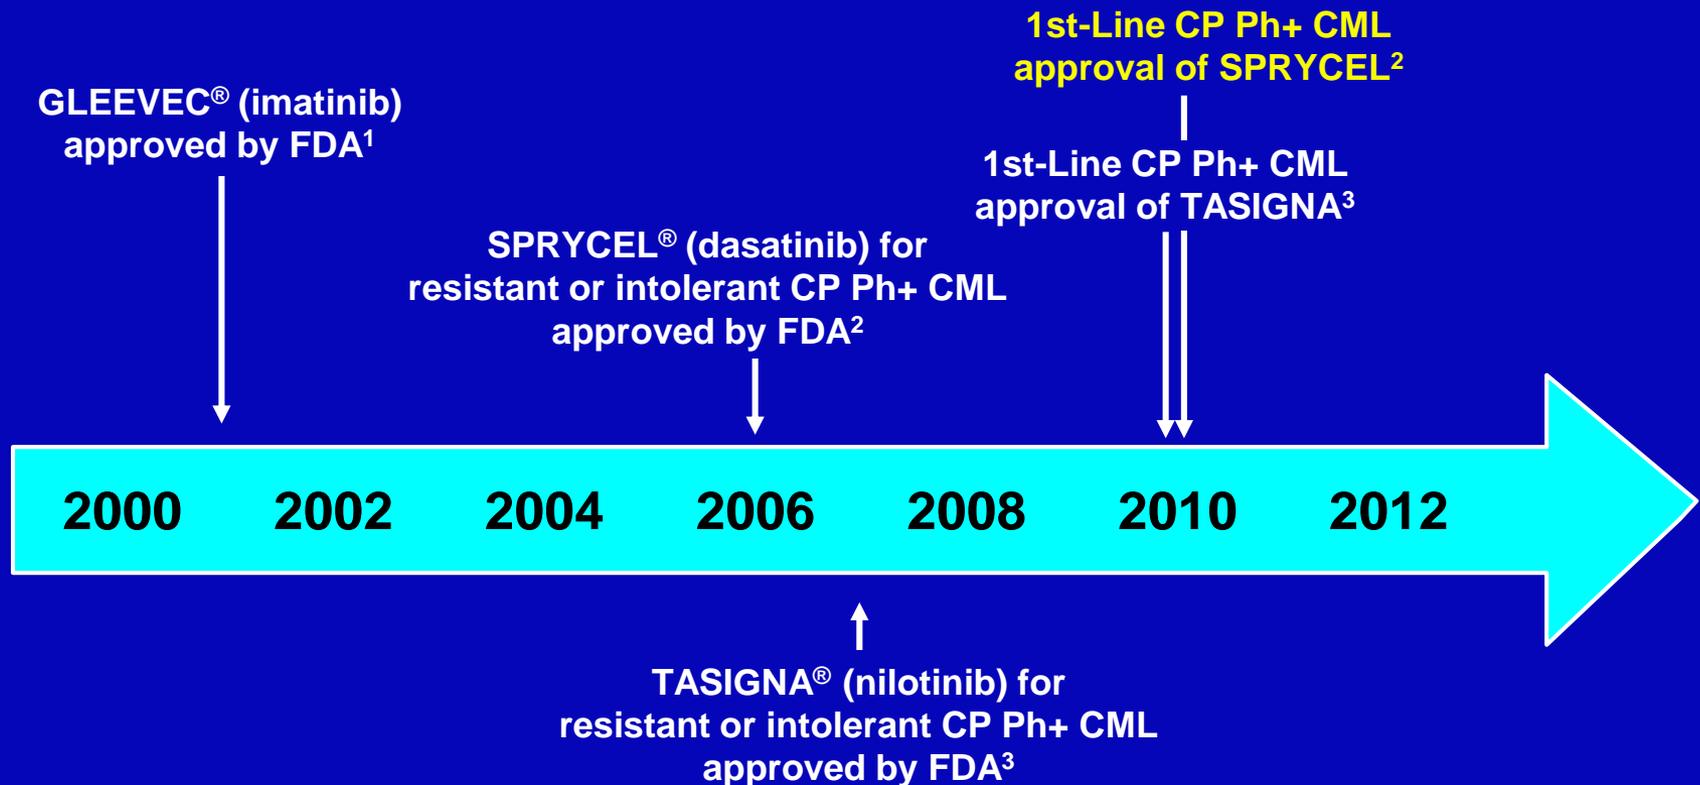

<sup>a</sup> One dasatinib and one imatinib patient transformed but did not have 3-month molecular assessments.

<sup>b</sup> Including follow-up beyond discontinuation (intent to treat).

# Conclusions

- 5-Year follow-up demonstrates:
  - Deeper molecular responses with dasatinib versus imatinib
  - More optimal molecular responses with dasatinib versus imatinib
  - Fewer transformations to AP/BP
- Achievement of BCR-ABL  $\leq 10\%$  at 3 months is associated with significantly higher PFS and OS by 5 years
  - BCR-ABL  $\leq 10\%$  at 3 months: dasatinib 84% versus imatinib 64%
- By 5 years, 42% of dasatinib-treated patients had achieved MR<sup>4.5</sup>, a key eligibility criterion for many treatment-free remission studies
- Side effects that appear unique to dasatinib include pleural effusion and pulmonary arterial hypertension.

# Evolving CML Treatment Landscape

# Dasatinib and Nilotinib in Previously Untreated Chronic Phase CML Patients

## Concluding Thoughts

- Nilotinib and dasatinib are superior to imatinib at achieving deep responses
- Tolerability of these agents appears comparable to imatinib
- Patients and physicians now have three approved TKI treatment options for newly diagnosed chronic phase CML

# The First of Many Great Curveballs of 2016

- In February 2016, generic imatinib became available in the USA
  - In February, with one generic manufacturer, the annual cost of generic imatinib was \$142,000 (compared with \$145,750)
  - In August, additional generic formulations were permitted to be introduced into the marketplace, but even with 4-5 generic manufacturers, the annual price is currently about \$131,000
- Some insurance plans are refusing to authorize prescriptions for dasatinib or nilotinib until a patient has first tried imatinib

# Is Generic Imatinib Equivalent to Brand-Name Drug?

- “Imatinib Generics in Treatment of CML: A Prospective Observation in Large Cohort of Patients from Polish Imatinib Generics Registry” (abstract 629)
  - Found that rates of response in newly diagnosed CML patients with generic imatinib were as expected from historical experience with brand-name imatinib, and that response was typically maintained in patients who switched from brand-name to generic imatinib.
- “Generic Imatinib in CML: Survival of the Cheapest” (abstract 630)
  - Found comparable efficacy and safety between generic and brand-name imatinib in India

# **IMATINIB-RESISTANT ACCELERATED AND BLAST PHASE CML**

# Summary of efficacy in accelerated phase CML

Dasatinib CCyR rate imatinib-resistant and -intolerant patients<sup>1</sup>:

- 24% (n=107)

Nilotinib CCyR rate imatinib-resistant and -intolerant patients<sup>2</sup>:

- 16% (n=119)

<sup>1</sup>Guilhot et al, Blood 109:4143-50.

<sup>2</sup>le Coutre et al, Blood 111:1834-9.

# Summary of efficacy in blast phase CML

Induction chemotherapy achieves morphologic CRs in approximately 10-15% of MBC patients

Dasatinib CCyR rate imatinib-resistant and -intolerant patients<sup>1</sup>:

-MBC: 27% (n=109)

-LBC: 48% (n=46)

-Documented CNS disease clearance

Nilotinib CCyR rate imatinib-resistant and -intolerant patients<sup>2</sup>:

-MBC: 29% (n=105)

-LBC: 32% (n=31)

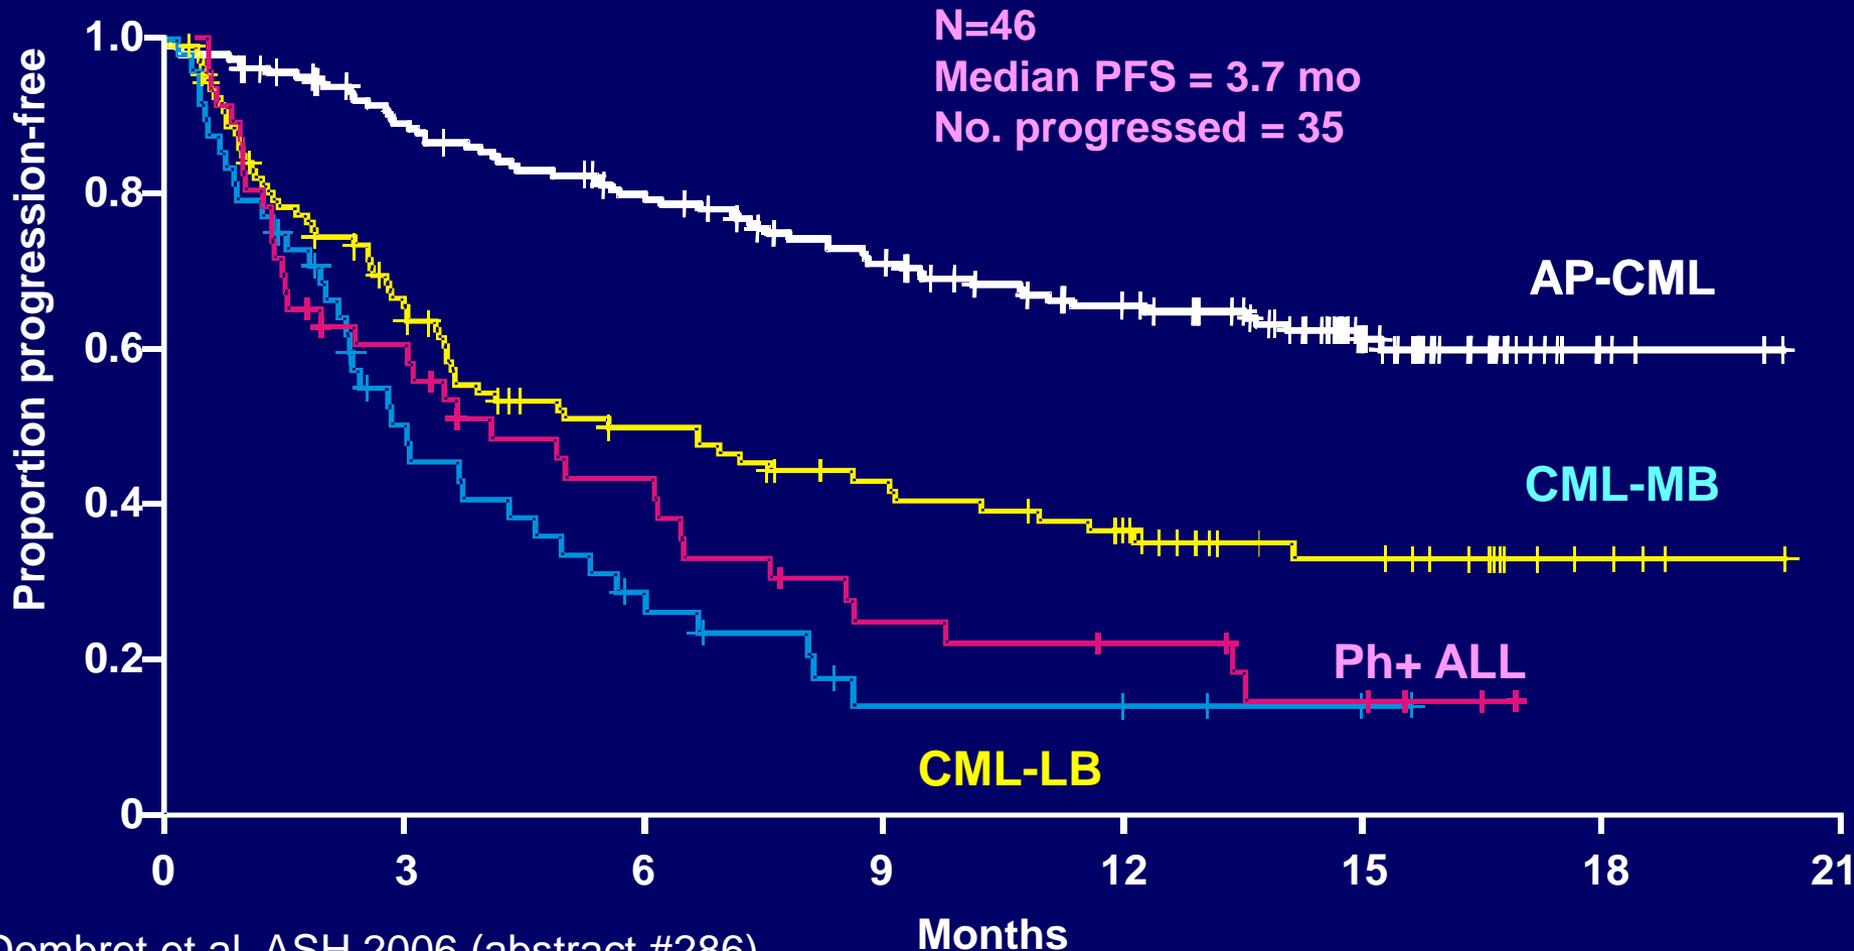

-Not currently approved for blast phase CML

# Bosutinib in CP CML

## Conclusions

- Clinical efficacy in CP CML resistant or intolerant to imatinib (and other TKIs)
- Responses across a wide range of mutations, but not T315I
- Acceptable toxicity profile
  - Self-limiting diarrhea, liver function test abnormalities
  - Low hematologic toxicity

<b>Total Arterial Thrombosis</b>	<b>34 (8)</b>	<b>51 (11)</b>	<b>53 (12)</b>	<b>77 (17)</b>

- **1.7-fold increase in exposure over additional 13 mos of follow-up**
- **Incidence of serious AEs increased from 8% to 12%**
- **Median time to onset: 215 days (range 3-887 days)**

# Ponatinib Phase 2 Study

## Incidence of Vascular Occlusive Events Over Time

Data as of:	N=449 n (%)			
	23 July 2012 (USPI)		03 Sep 2013	
	12 months [340 patient-yrs]		24 months [578 patient-yrs]	
Category	SAE	AE	SAE	AE
Cardiovascular	21 (5)	29 (6)	28 (6)	41 (9)
Cerebrovascular	8 (2)	13 (3)	18 (4)	25 (6)
Peripheral vascular	7 (2)	17 (4)	16 (4)	28 (6)
Total Arterial Thrombosis	34 (8)	51 (11)	53 (12)	77 (17)
Venous Thromboembolism	10 (2)	15 (3)	13 (3)	23 (5)

- In October 2013, inclusion of venous thromboembolism events (3 SAEs in intervening months) to create Vascular Occlusion category

# Ponatinib Phase 2 Study

## Impact of Dose Modification on Response

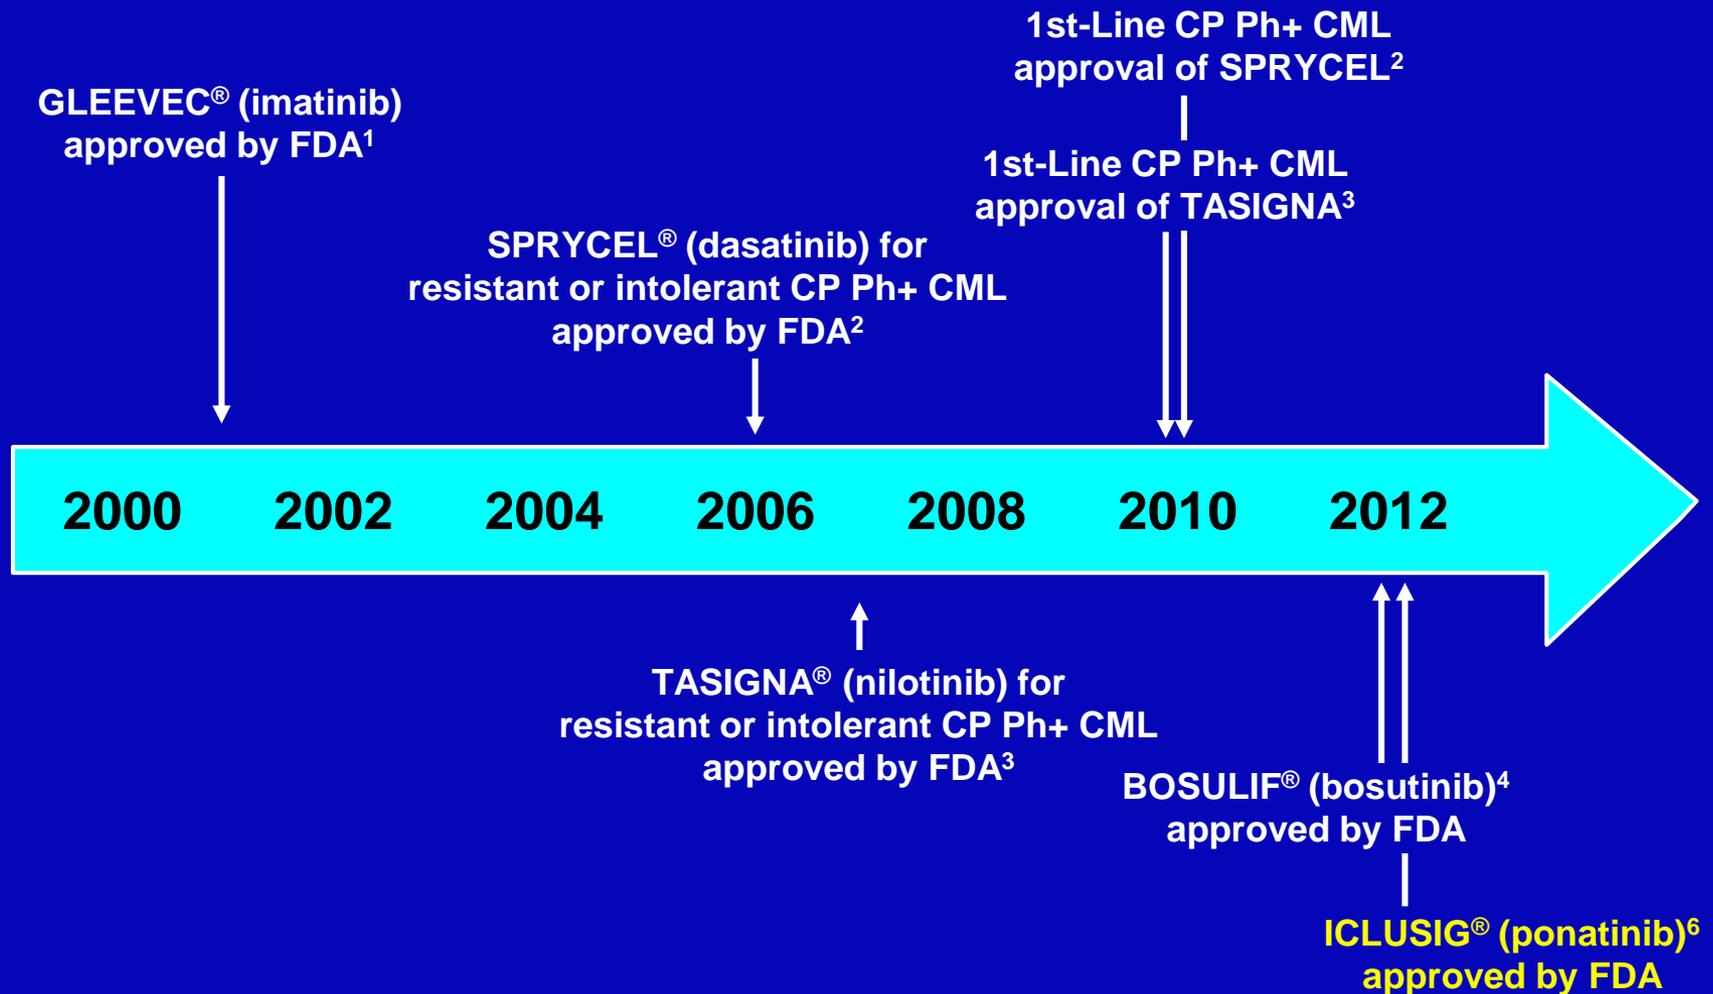

- 149 CP-CML patients achieved MCyR by 12 mos
- Among patients who dose reduced after achieving response
  - 97% (62/64) maintained MCyR
  - 96% (51/53) maintained CCyR
  - 92% (34/37) maintained MMR

# Ponatinib Phase 2 Study - PACE

## 2 Year Follow-up Summary

- Confirmed substantial clinical activity in heavily pretreated patients with BCR-ABL+ leukemias
- Early, deep, and durable responses were observed; 89% maintained MCyR for at least 2 yrs in CP-CML
- Arterial thrombotic events occurred; higher dose intensity, older age, presence of other risk factors at baseline associated with higher likelihood of event
- Ponatinib is an important treatment for patients in whom the need and potential benefit outweigh the potential risk

# Evolving CML Treatment Landscape

# Omacetaxine is a Recently Approved Protein Synthesis Inhibitor <sup>115</sup>

**Table 3. Response rates in chronic-phase CML patients treated with omacetaxine**

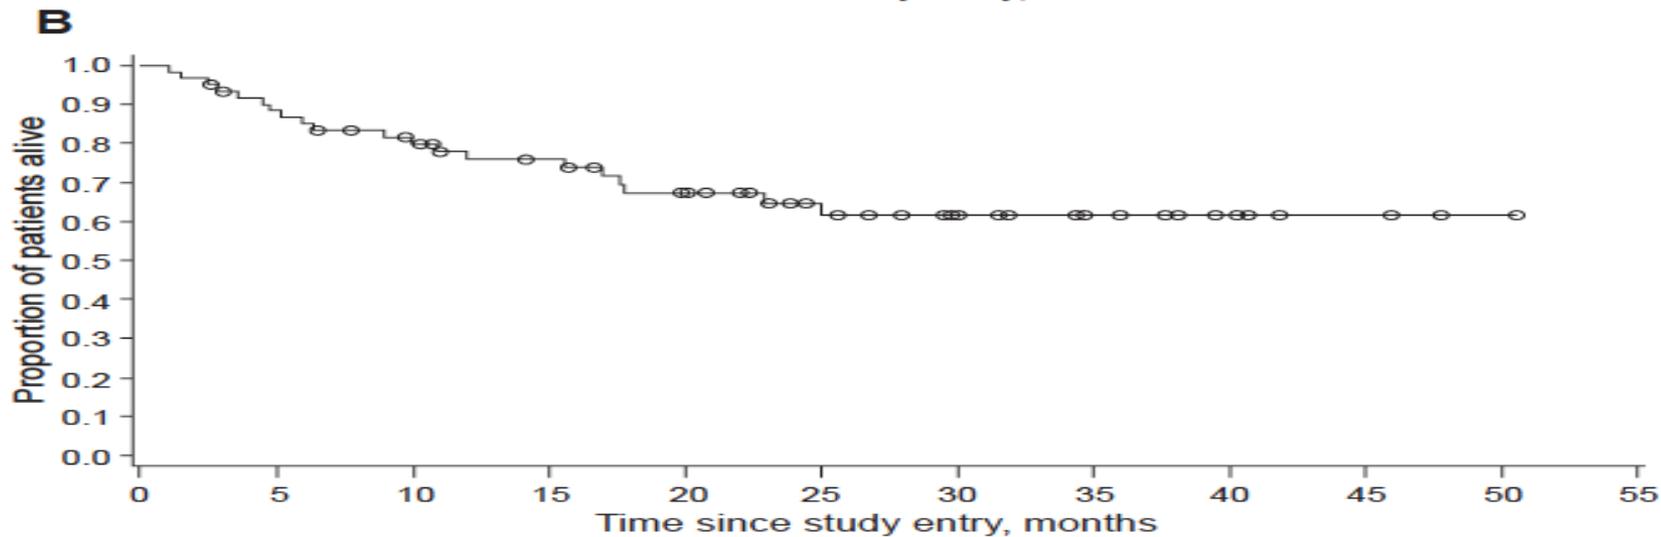

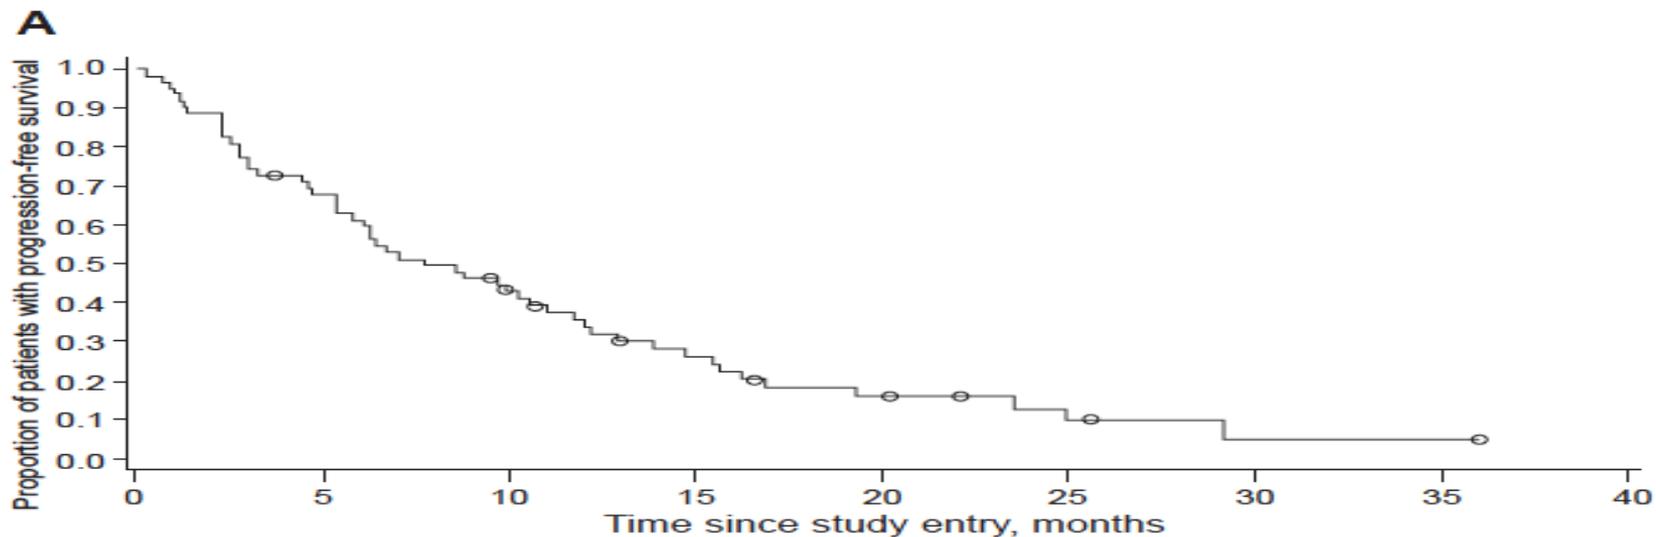

Response	Patients treated, n (%), N = 62
<b>Hematologic response categories</b>	
Complete hematologic response	48 (77%; 95% LCL, 65%)
No response	12 (19)
Unevaluable	2 (3)
<b>Cytogenetic response categories</b>	
Major	14 (23%; 95% LCL, 13%)
Complete: 0% Ph <sup>+</sup> cells*	10 (16)
Partial: > 0%-35% Ph <sup>+</sup> cells*	4 (6)
Minor	3 (5)
Minimal	10 (16)
No response	23 (37)
Unevaluable†	12 (19)

CML indicates chronic myeloid leukemia; and LCL, lower confidence limit.

\*Includes both confirmed and unconfirmed response. Unconfirmed response is based on a single bone marrow cytogenetic evaluation for patients where a confirmatory evaluation is not available.

†Patients with unevaluable cytogenetic responses are those with no postbaseline bone marrow assessment.

# Omacetaxine for CP-CML Patients with the T315I Mutation <sup>116</sup>

# Omacetaxine in CP-CML: Adverse Events 117

**Table 6. Most frequent (> 10%) adverse events associated with omacetaxine**

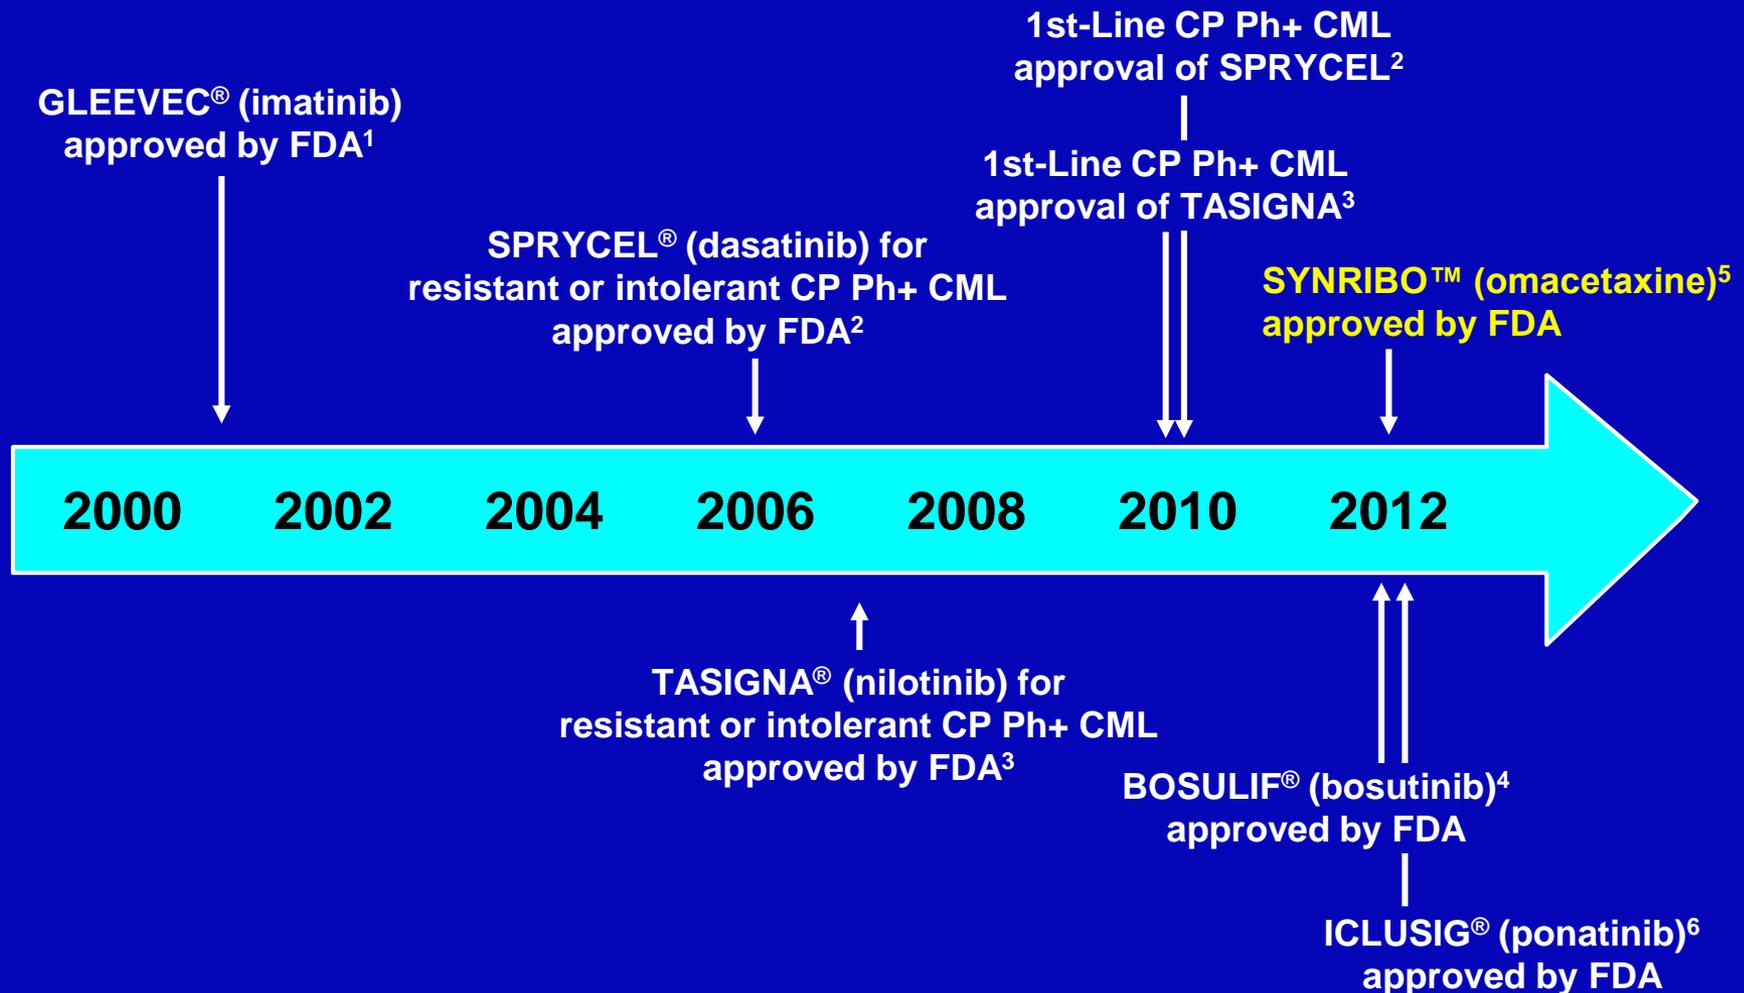

Adverse event	Patients, n (%)		
	All grades	Grade 3/4	Grade 5
<b>Hematologic</b>			
Thrombocytopenia	49 (79)	47 (76)	0

Rash	7 (11)	0	0
Myalgia	7 (11)	1 (2)	0

\*Includes all preferred terms in system organ class "Infections and Infestations."

# Omacetaxine Conclusions

- Omacetaxine is a first-in-class protein synthesis inhibitor with modest activity in highly pretreated CP-CML and accelerated phase patients, including those with the BCR-ABL T315I mutation
- Response duration appears to be modest
  - Nine of 108 patients remain on treatment after ~5 years
- Grade 3/4 myelosuppression is common
- Non-hematologic grade 3/4 toxicities are uncommon
- Omacetaxine was approved by the US FDA in October 2012 for the treatment of imatinib-resistant chronic and accelerated phase CML.

# Evolving CML Treatment Landscape

# **PROMISING AGENTS UNDERGOING CLINICAL INVESTIGATION**

**Expanded Phase I Study of ABL001, a Potent,  
Allosteric Inhibitor of  
BCR-ABL1, Reveals Significant and Durable  
Responses in Patients With CML-Chronic Phase  
With Failure of Prior TKI Therapy**

Hypophosphatemia	7 (6)	1 (1)
Neutropenia	7 (6)	5 (4)

# Responses in Patients With CML Treated With Single-Agent BID ABL001 With $\geq 3$ Months Exposure on Study

CCyR, complete cytogenetic response; CHR, complete hematologic response; IS, International Scale; MMR, major molecular response.

<sup>a</sup> Patients had  $\geq 6$  months of treatment exposure or achieved response within 6 months.

<sup>b</sup> *BCR-ABL* <sup>1S</sup> reduction achieved.

<sup>c</sup> Patients had  $\geq 12$  months of treatment exposure or achieved response within 12 months.

## Responses in CML Patients Resistant to Last TKI

- 47 of 77 (61%)<sup>a</sup> patients with CML treated with single-agent ABL001 BID were resistant to their last TKI<sup>b</sup>
- Responses in all TKI-resistant patients treated with single-agent ABL001 BID
  - 13.3% and 37.5% achieved MMR by 6 and 12 months, respectively
  - 29.4% and 42.9% achieved  $\geq 1$ -log reduction by 6 and 12 months, respectively
  - 8 of 10 (80%) patients  $> 35\%$  Ph+ achieved CCyR by 6 months

<sup>a</sup> % calculated based on number of evaluable patients for each endpoint and by each time point.

<sup>b</sup> Includes imatinib, nilotinib, dasatinib, bosutinib, radotinib, ponatinib.

## Responses in CML Patients with T315I Mutation

- 11 of 77 (14%) CML patients treated with BID ABL001 had T315I mutations at baseline; 10 had 3 months' follow-up
  - 4 of 10 patients > 35% Ph+ achieved CCyR by 6 mo
  - 6 patients have maintained stable disease without achieving CCyR or MMR
  - No patients have progressed to blast crisis
  - 1 patient has maintained baseline MMR for > 1 year
- Dose escalation for T315I-mutant patients is ongoing to explore whether higher doses can achieve deeper molecular responses

# Conclusions

- ABL001 was generally well tolerated in heavily pretreated patients with CML resistant to or intolerant of prior TKIs
- Clinical activity seen in patients with nonmutant BCR-ABL1 as well as across multiple TKI-resistant mutations
  - Only 1 patient with relapsed or progressive disease had detectable mutations (both kinase and myristoyl domain mutations)
- Recommended dose of 40 mg BID declared for patients with CML-CP without T315I mutations
- Phase I enrollment is ongoing for other cohorts
- These findings support further evaluation in phase 2/3 clinical trials

# Newer Treatment Options

## Concluding Thoughts

- Bosutinib and ponatinib are approved for patients with resistance or intolerance to a prior TKI
- Omacetaxine is approved for patients with disease that is resistant or intolerant to two or more TKIs
- There is now an effective tyrosine kinase inhibitor option for every known imatinib-resistant BCR-ABL kinase domain mutation
- ABL001 binds to a distinct region of BCR-ABL and may therefore retain clinical activity against many TKI-resistant mutations. Clinical trials are ongoing to define an optimal dose for patients with the T315I mutation.

# IMATINIB DISCONTINUATION STUDIES

*Can imatinib be safely stopped in patients with deep molecular responses?*

# Long-term Follow-up of the French Stop Imatinib Study (STIM1) in Chronic Myeloid Leukemia Patients\*

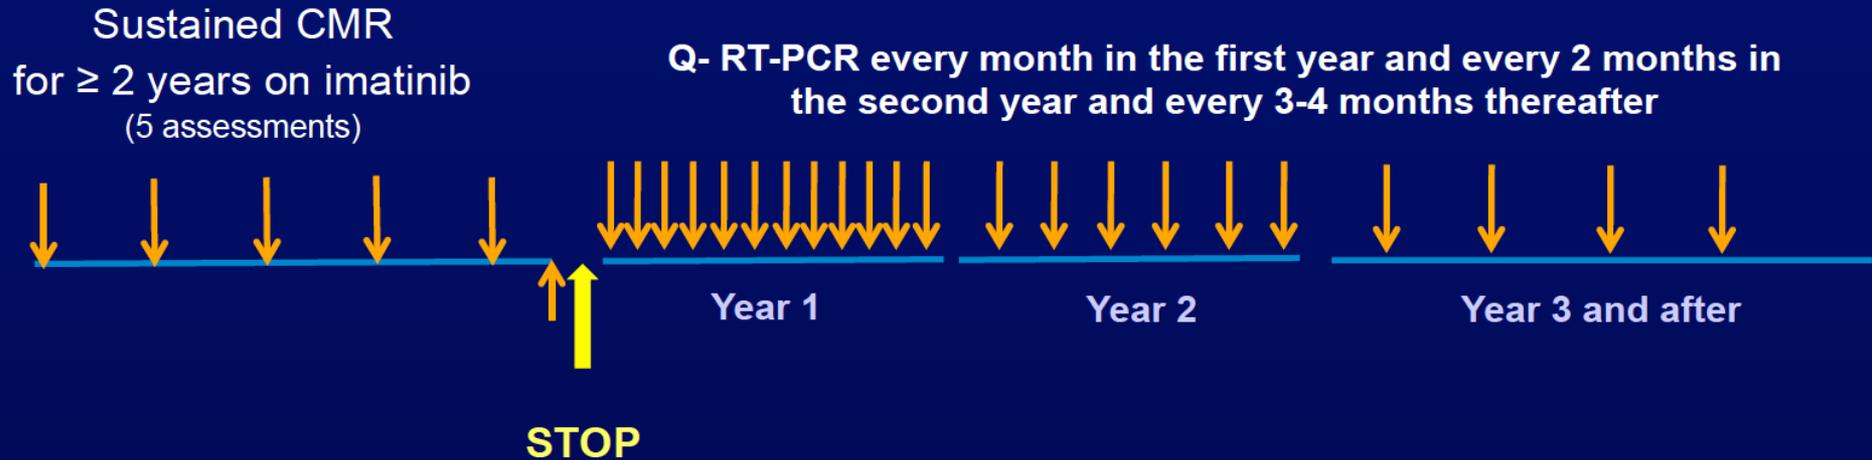

Gabriel Etienne, Delphine Réa, Joëlle Guilhot, François Guilhot,  
Françoise Huguet, Laurence Legros, Franck Nicolini Aude Charbonnier,  
Agnès Guerci, Bruno Varet, Philippe Rousselot, François-Xavier Mahon  
on behalf of the Intergroupe Français des Leucémies Myéloïdes  
Chroniques (FILMC) **on behalf of the STIM Investigators**

\*This study is registered with ClinicalTrials.gov, number NCT00478985

Orlando, ASH 2015, abstract 85121

# STIM study design\*

N=100

Molecular recurrence: positivity of *BCR-ABL* transcript confirmed by a second consecutive analysis point indicating a increase of one log or loss of MMR at one point.

Molecular recurrence  Imatinib rechallenge

\* Mahon FX et al. *The Lancet Oncology*, 2010;11(11): 1029-1035.

# Characteristics of patients included in the STIM Study

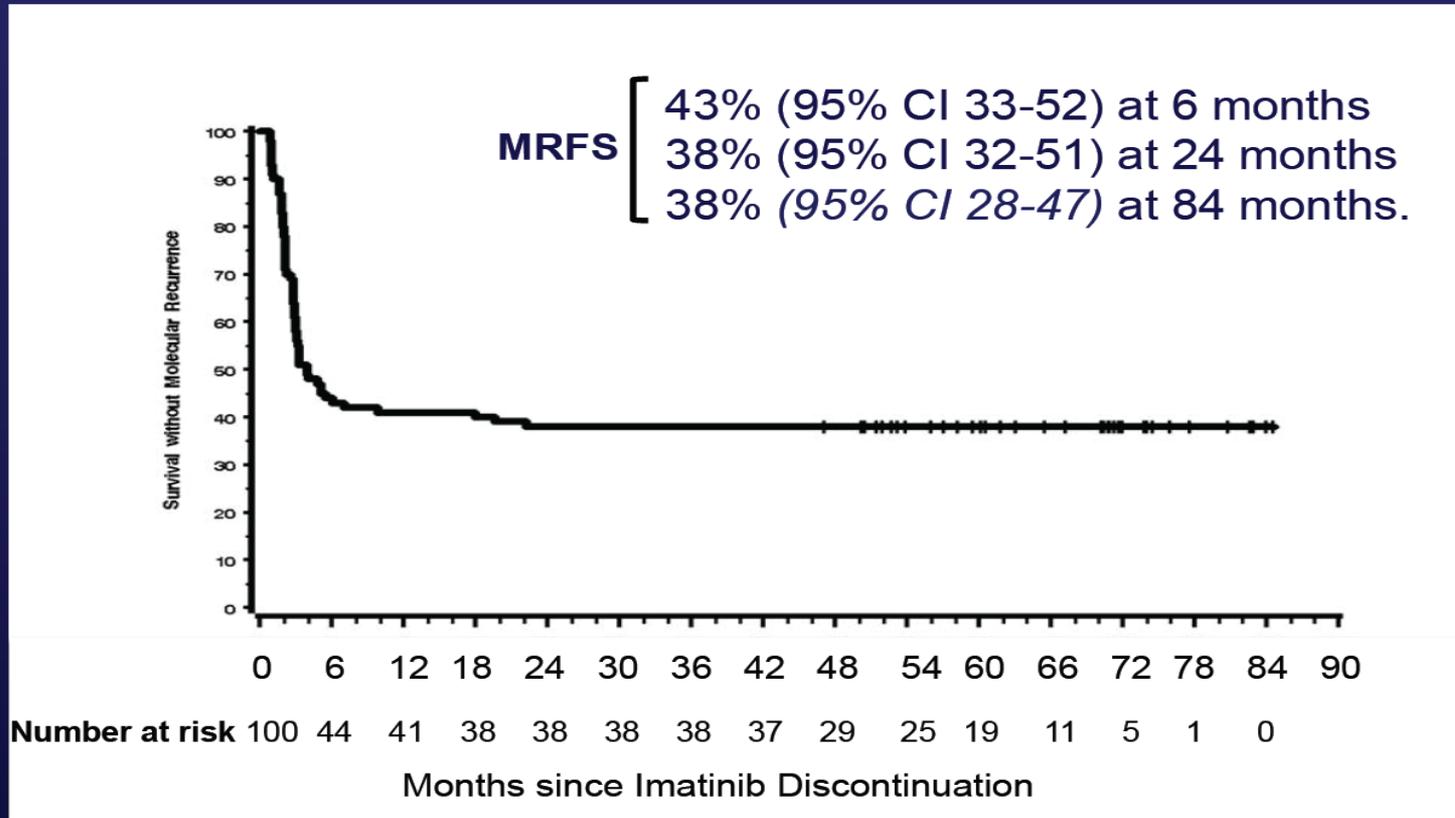

A prospective, multicentre, non-randomized study with 19 participating institutions in France:

- 100 patients enrolled between July 2007 and Dec 2009
- Median age (range): 59 years (29–81)
- Gender distribution: 48 males, 52 females
- Patients with previous IFN treatment: 50
- *De novo* CML patients: 50
- Median follow up: 65 months

# Molecular Recurrence-free Survival (MRFS)

MRFS after imatinib discontinuation – Median Follow-up = 65 mo.  
accounting for competing events (death in complete molecular remission without any relapse, n=1)

Imatinib was restarted in 57 patients, and 55 re-achieved their initial level of response

Five patients died of causes unrelated to CML

No patient experienced CML progression

# Conclusion

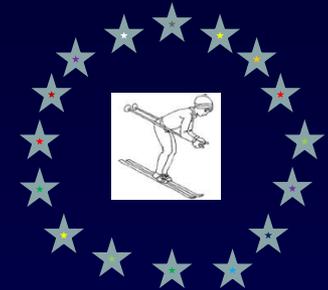

## **With a longer follow-up (65 mo.) after imatinib discontinuation**

- No CML event progression have been reported
- Most if not all relapsing patients have achieved a second deep molecular response after TKI resumption
- Molecular recurrence was very rare after 6 months and no molecular recurrence was reported after 2 years

## **Imatinib discontinuation is safe** provided that:

- A deep sustained molecular response have been achieved before discontinuation
- A close molecular monitoring is available after treatment cessation

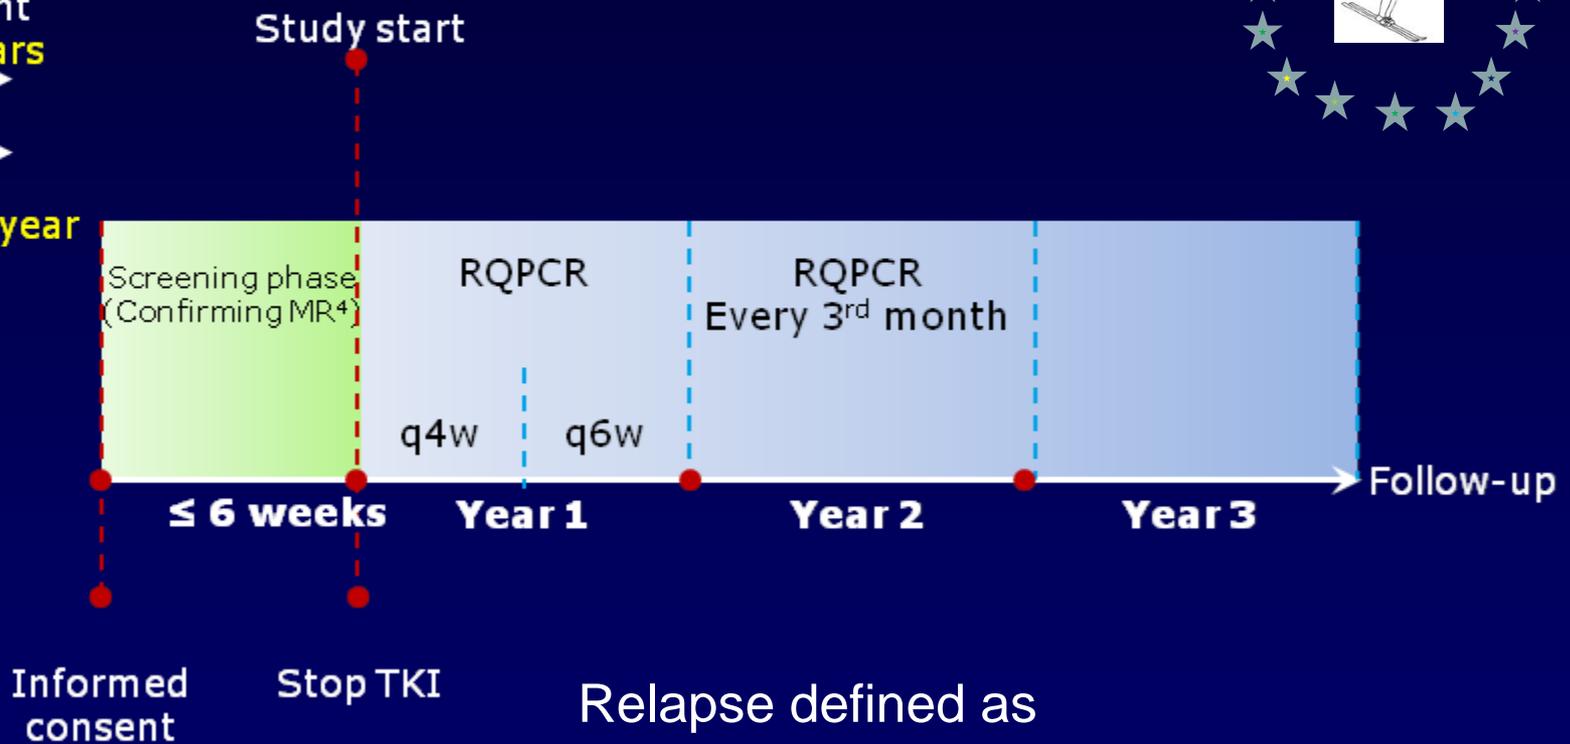

# EURO-SKI Study Design

## Inclusion criteria

TKI treatment  
at least 3 years  
----->

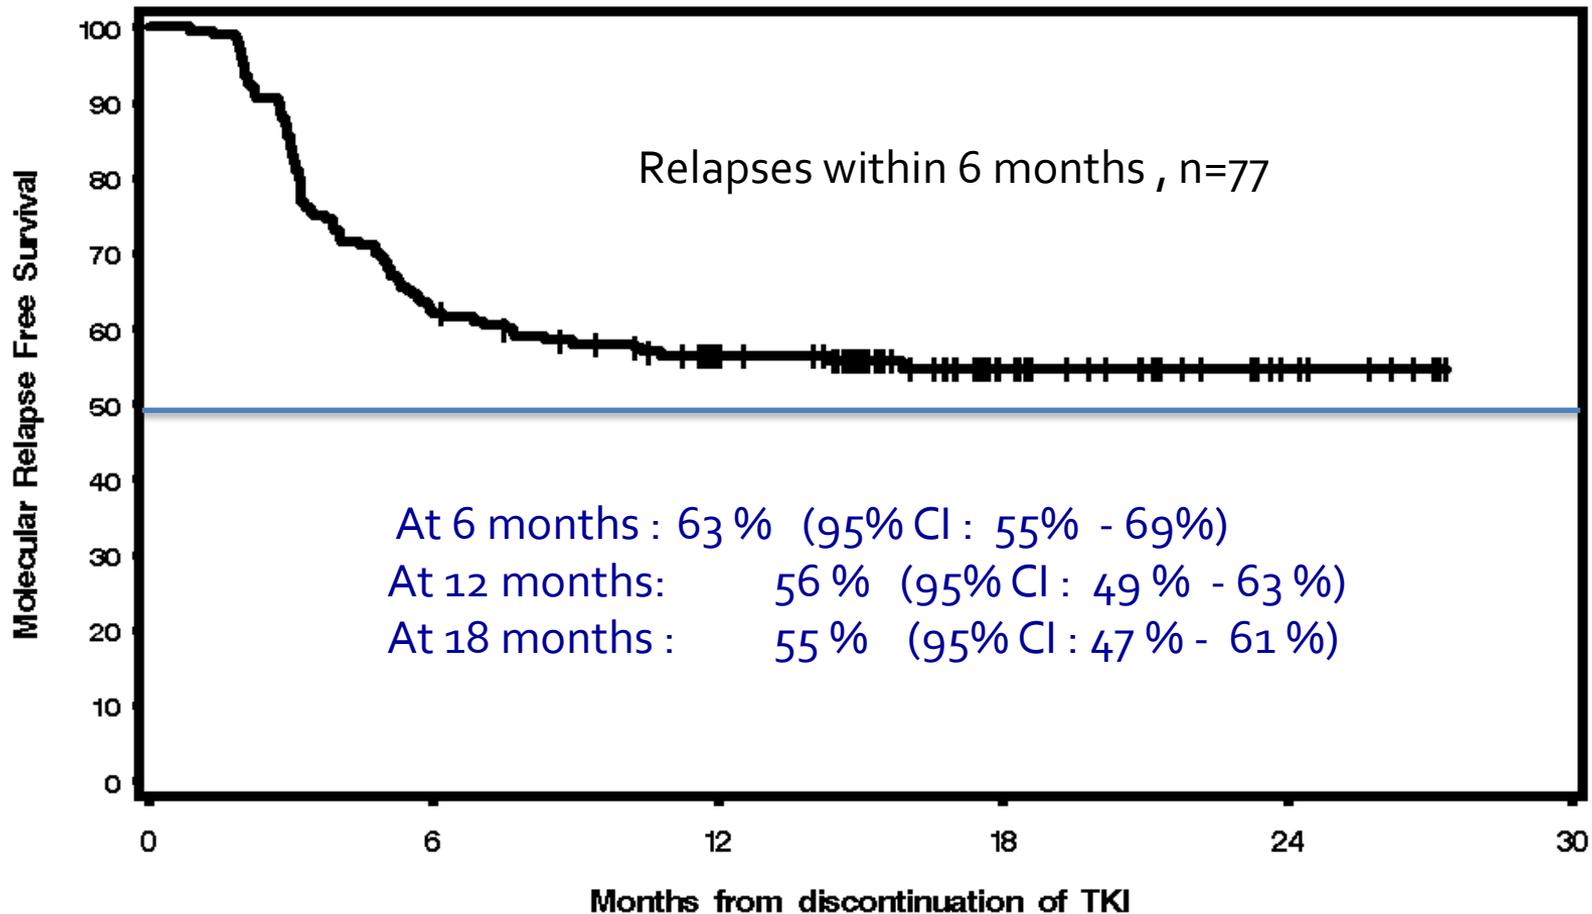

----->  
MR<sup>4</sup>  
at least 1 year

Relapse defined as  
BCR-ABL > 0.1% (loss of MMR) on the  
IS at one time point

# EURO-SKI: Molecular Relapse Free Survival

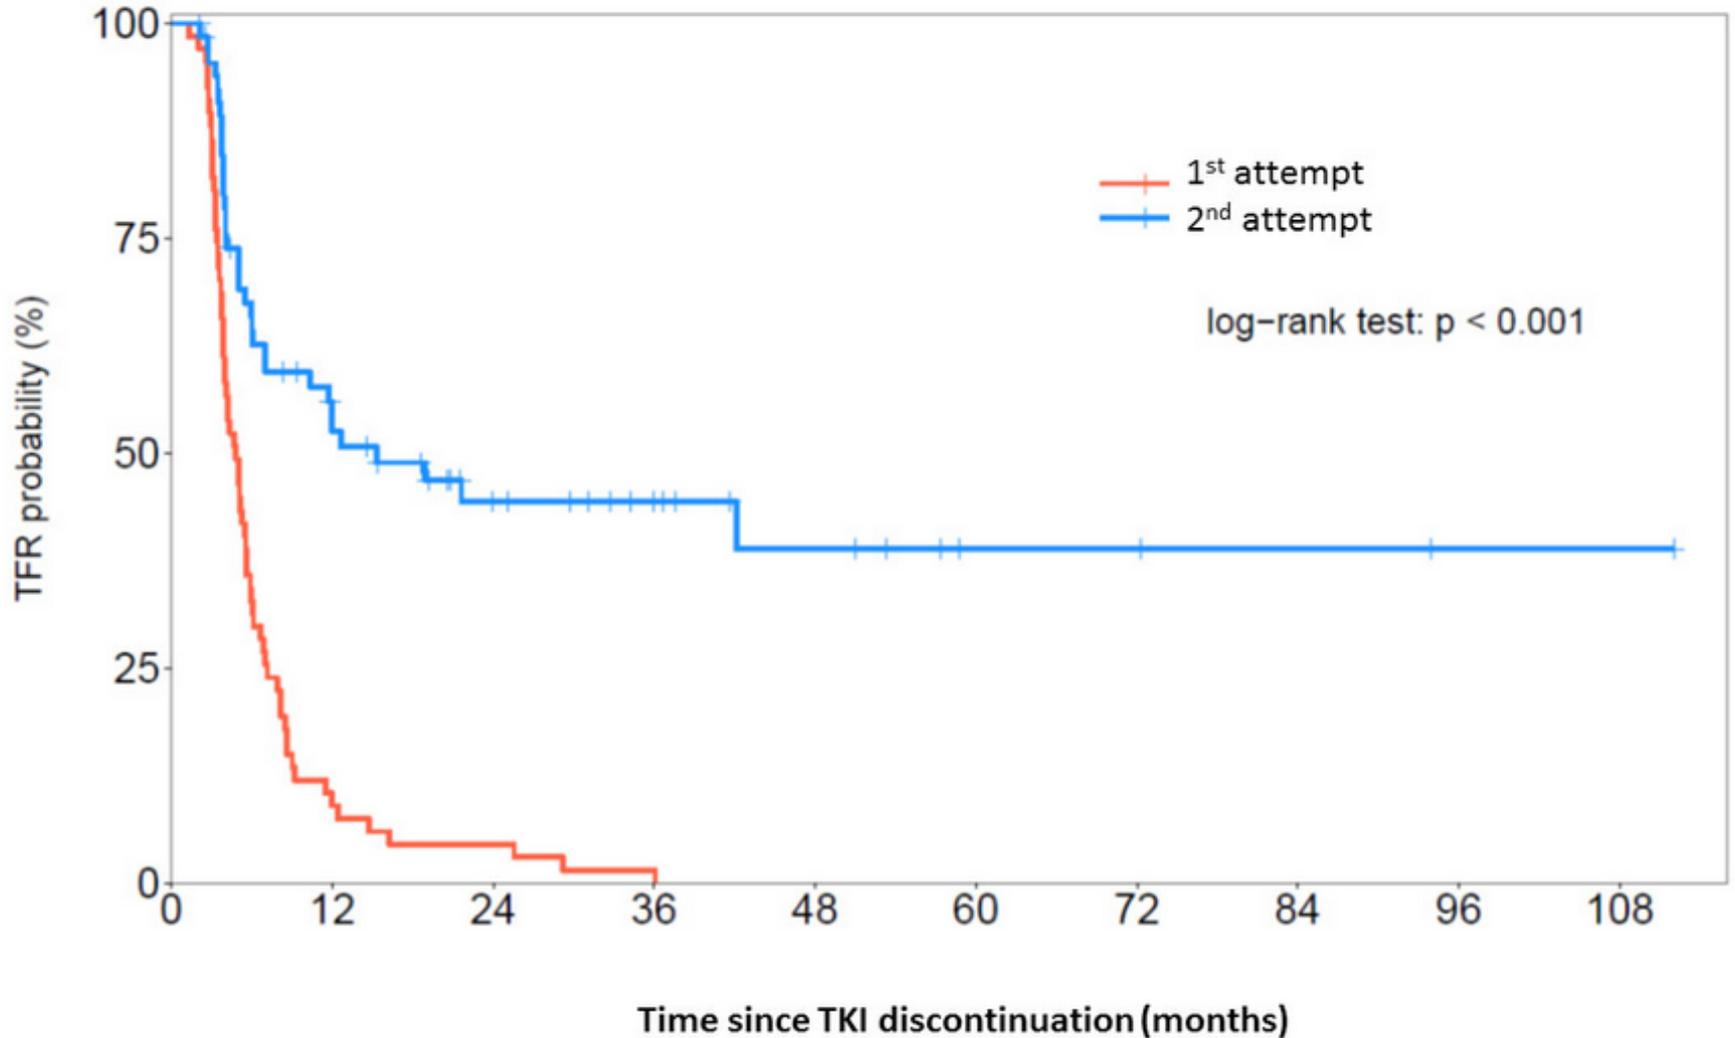

200 interim patients – overtime, loss MMR=89

# IMATINIB DISCONTINUATION STUDIES

*Can patients whose disease relapses  
off treatment successfully discontinue  
in the future?*

# Second TKI Discontinuation in CML Patients Who Regained Deep Molecular Response Following TKI Rechallenge

# TKI DISCONTINUATION

*Is it possible for more patients to achieve a deep remission so that they may ultimately try stopping treatment?*

# Clinical Trials Aimed at Deepening Molecular Response

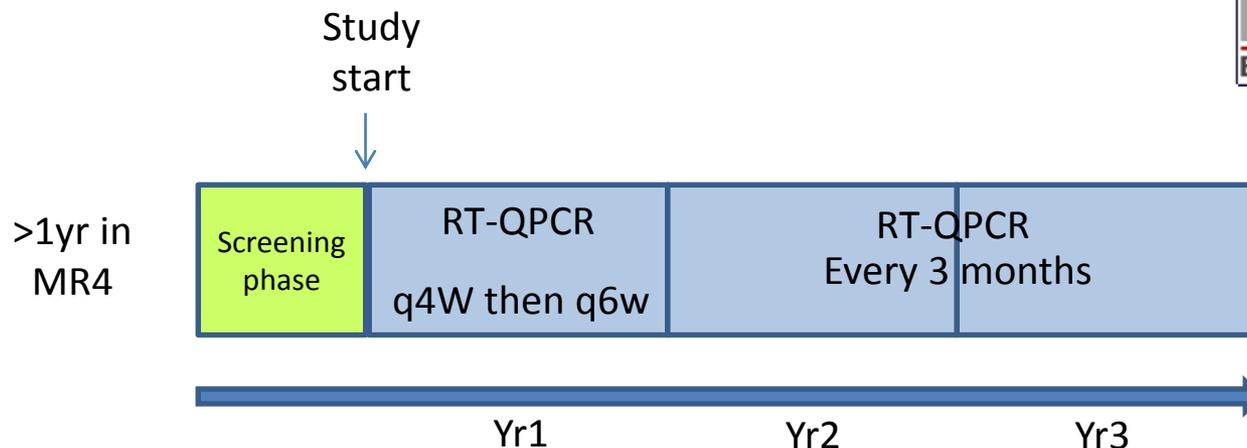

- TKI + Smo inhibitors (failed)
- TKI + hydroxychloroquine (unknown status)
- TKI + ruxolitinib (ongoing)
- TKI + inteferon (ongoing)
- TKI + pioglitazone (ongoing)

# TKI DISCONTINUATION

*Is it possible that symptoms may develop with treatment interruption?*

# Context

- Richter et al. first reported a “tyrosine kinase inhibitors withdrawal” syndrome consisting in musculoskeletal pain after stopping imatinib in CML patients included in the Euroski trial. (*Richter et al.*, JCO, 2014).

- Beside the Euroski trial, we are currently running the STIM-2 study in France and prospectively recording all events from the time of TKI discontinuation.

# STIM2 & French EUROSKI cohorts: Prevalence of WS

# STIM2 & French EUROSKI cohort: Risk factors for WS

All patients	Without WS	With WS	<i>p-value</i>
<b>Sex</b> (H/F (ratio))	158/168 (51.5)	50/52 (51.0)	0.92
<b>Age</b> (median; range)	61.9 ± 14.4	63.1 ± 9.5	0.33
<b>Sokal, n (%)</b>			0.15
Low	115 (40.6)	49 (49.5)	
Intermediate	129 (45.6)	34 (34.3)	
High	39 (13.8)	16 (16.2)	
<b>CML duration</b> (months, mean ± SEM)	8.7 ± 3.1	9.7 ± 3.8	0.02
<b>Time on TKI</b> (months, median [IQR])	81.2 [61.2 – 108.0]	97.3 [73.7 – 122.9]	<0.001
<b>TKI, n (%)</b>			0.42
DAS	1 (0.3)	0 (0.0)	
IMA	323 (99.1)	100 (98.0)	
NIL	2 (0.6)	2 (2.0)	
<b>Previous history of osteo articular symptoms (n (%))</b>	28 (9.8)	19 (22.9)	0.002

# Discussion - 1

- The TKI withdrawal syndrome occurred in 23% of French patients included in the Euroski and STIM-2 discontinuation trials
- For patients having to restart TKIs, WS disappeared in 50% of the case after a median of 3 weeks

Study	Prevalence	Onset	TKI	Location	Duration
Richter <i>et al.</i> 2014 (n = 50)	30%	< 1 month	Imatinib	Shoulders Hips	A few weeks to several months
This study (n= 428)	24%	21 days	Imatinib and nilotinib (n=2)	Shoulders Spine	A few weeks to several months

# Treatment Cessation: Conclusions

- With longer follow-up:
  - Approximately 40-60 percent of patients in stable deep molecular response are able to discontinue imatinib without suffering molecular relapse
    - Second attempts at treatment discontinuation in patients who have suffered molecular relapse can be successful
- Many ongoing trials have been performed to assess the safety and efficacy of TKI cessation in sustained molecular remission. Under proper supervision, it is now possible for select patients treated in the community to try discontinuing treatment.
- Significant long-term follow-up (decades) of patients enrolled in ongoing cessation studies is necessary to affirm CML cure.
- Some patients may experience a “TKI withdrawal syndrome” upon stopping treatment.

# Conclusions - I

- Imatinib is favorably impacting survival in patients with chronic phase CML
  - ~65% are estimated to be on imatinib in CCyR after 7 years
  - ~25% of patients meet the definitions of resistance within the first 18 months of therapy
- Dasatinib, nilotinib, bosutinib and ponatinib are effective in cases of imatinib -resistant and -intolerant chronic and accelerated phase of CML
- Nilotinib and dasatinib are approved for the treatment of newly diagnosed chronic phase CML patients
- Achieving a reduction in BCR-ABL transcript level to  $\leq 10\%$  after 3 months of TKI treatment is associated with superior outcomes. The slope of decline may be as important.

# Conclusions - II

- Loss of response to dasatinib, nilotinib and bosutinib is most often due to a small number of BCR-ABL kinase domain mutations (~5), commonly the T315I mutation
  - In cases where the T315I mutation is not the cause of resistance, it is reasonable to try treatment with another of these drugs
  - Ponatinib may be effective against all single BCR-ABL mutants, but there are some safety concerns that limit its use
- ABL001 is an investigational agent that is showing signs of efficacy in early experience, including in some cases that have the T315I mutation
- Adequate monitoring of disease burden in CML patients is essential, and CML patients are encouraged to consult with a CML expert to ensure their disease is being optimally managed
- Some patients with sustained deep molecular responses can stop treatment for at least several years. Monitoring is essential.

# Conclusions - III

- In 2017, the remaining frontiers for the management of CML remain
  - Improving outcomes in advanced phase CML patients
  - Understanding and treating mechanisms of BCR-ABL-independent resistance to TKIs
  - Determining why some patients are able to successfully discontinue treatment but others are not
  - Eliminating the small proportion of CML cells that remain in most patients with deep responses so that they may be able to discontinue therapy altogether (“true cure”)
    - Studies with investigational agents are currently ongoing
- The continued participation of CML patients in clinical trials is essential to further improve treatment outcomes
