Welcome to the Gallbladder Cancer Handbook presented by PearlPoint Cancer Support.

About The Gallbladder Cancer Handbook

Having just been diagnosed with gallbladder cancer, you probably have a lot of questions. In this Handbook, you’ll find everything you need to know to more confidently manage your cancer journey from diagnosis through treatment and survivorship. The Handbook can be your guide.

With the internet and search engines, it’s easy to find information about any gallbladder topic, but not all of it is reliable and trustworthy. But don’t worry! PearlPoint’s Gallbladder Cancer Handbook is a reliable source of information. All of the content in the Gallbladder Cancer Handbook has been reviewed and approved by medical professionals across the U.S. who participate on PearlPoint’s Scientific Advisory Team.

Using the Handbook, you will first learn how to talk about cancer with your healthcare team, family, and friends. As a cancer patient, being able to speak openly and honestly with your healthcare team is important. Communication with your caregiver and loved ones is important as well. You are not alone in your cancer journey.

Next, you will learn about gallbladder cancer and the available treatment options. No two cancer diagnoses are the same. The best treatment for you may not be the best treatment for another patient. Use the information in the Handbook to talk with your healthcare team about your options to create the best treatment plan for you.

Cancer and cancer treatments cause side effects, but most side effects are manageable. Know what to expect. Different treatments have different side effects, and people may respond to treatment in unique ways. The Handbook will walk you through all the possible side effects and tips for managing them.

Nutrition is also a big part of any cancer patient’s journey and a large part of the Handbook. Proper nutrition during your cancer treatment can help you feel better, maintain your strength, and speed your recovery. After treatment, good nutrition will continue to be an active part of your life in survivorship.
As you likely may imagine, a cancer diagnosis brings with it many practical life concerns—health insurance, finances, transportation, advanced directives. The Handbook contains information and content that will help you learn to manage the practical concerns of cancer during your treatment. But even when treatment ends, the cancer journey is not over. During survivorship, there are many things you can do to promote wellness and help you readjust to life after cancer. The Handbook will provide help and information.

We hope you find the Handbook to be a valuable, frequently consulted tool as you manage your cancer journey. We encourage you to make it your own! Ask your nurse navigator or another member of your healthcare team to highlight the sections that most apply to your specific diagnosis and treatment plan. Use the worksheets in the back to keep track of all your information such as medical history and appointments. And finally, never hesitate to talk with your healthcare team—frequently, proactively, and openly.

**Nurse Navigator**

**What does a nurse navigator do?**

Nurse navigators work directly with cancer patients to help guide them through their cancer care journey. Nurse navigators serve as a constant point of contact for patients to coordinate care, answer questions, and provide resources. They will often be your first point of contact except in medical emergencies or unless otherwise directed. Nurse navigators usually specialize in a certain type of cancer to help patients with their specific needs.

As a cancer patient, your healthcare team may include a large number of people including:

- A medical oncologist
- A radiation oncologist
- Surgeon
- Pharmacist
- Dietitian
- Physical therapist
- Other healthcare professionals
- Your caregiver, family, and friends

Your nurse navigator will work closely with every member of your healthcare team to keep the lines of communication open.

Nurse navigators understand the medical, practical, and emotional needs of cancer patients. If you have questions about treatment, medications, appointments, or anything else related to your cancer journey, start by asking your nurse navigator.

**Who is my nurse navigator, and how do I contact him or her?**
Talking About Cancer
With Your Healthcare Team

When going through cancer treatment, your healthcare team is very important. Your healthcare team may include your oncologists, surgeon, nurse navigator, a dietitian, a social worker, or other medical professionals. Every member plays an important role. Use the tips below for talking with your healthcare team:

- Establish your main point of contact.
  - Your main point of contact will probably be a nurse navigator, but it may be another member of your healthcare team. Who should you contact first with questions?
- It is important to always be open and honest with your healthcare team about your physical and emotional well-being.
- Do not be afraid to ask questions.
  - Cancer is usually not a medical emergency. There is time to ask your healthcare team any questions you may have, and to consider your treatment options.
- Write your questions down before your appointments. Take a pen and paper to write down the answers. You can use the “Appointment Notes” worksheet at the back of the Handbook.
- Before beginning treatment, ask your healthcare team the following:
  - What are all my treatment options?
  - What are the long term and short term side effects of treatment, and how can I manage them?
  - Will my fertility or ability to have children be affected?
  - Am I eligible for clinical trials?
  - For more questions to ask your healthcare team, read “Questions for Your Healthcare Team” in this Handbook.
- If you develop any new problems or symptoms during treatment, tell your healthcare team immediately. You are not complaining. This is valuable information for your doctors.
• Do not change your diet, start an exercise program, or take any new medications, including vitamins and supplements, during treatment without talking to your healthcare team first.

With Your Caregiver

Your primary caregiver may be with you when you receive your diagnosis. Your primary caregiver may be your spouse, partner, adult child, parent, or friend. Your primary caregiver is the person who may come with you to appointments, take care of you after surgery or treatment, and support you throughout your cancer journey.

• Everyone reacts to the news of cancer differently. You may feel upset, shocked, or angry. It may take you some time to process the information. Your caregiver may react the same way you do, or your caregiver may not. Even if your caregiver does not react the same way you do, it does not mean that he or she does not care deeply.
• Establish your role and your caregiver’s role early. For example, will your caregiver be the one scheduling most of your appointments, or do you prefer to take an active role? Find what works best for you and your caregiver.
• Be open and honest with each other about how you both feel. Overly positive attitudes may hinder honest communication. It’s okay to be upset.
• Encourage your caregiver to take time to care for his or her own physical and emotional well-being. Being a caregiver comes with its own hardships.
• If your primary caregiver is your spouse or partner, your intimate and physical relationship may change. To learn more about intimacy issues and discussing them with your partner, read the “Sexual Side Effects” section of the Handbook.

With Your Children

Children are very perceptive, no matter their age. While you may wish to protect your children by not telling them about your diagnosis, even young children may be able to tell that something is wrong. Not knowing what is wrong may cause them more stress and anxiety. Here are some tips to talk to your children and teens about your cancer diagnosis:

• Wait until your emotions are under control and decide what to say ahead of time.
• Tell the truth and answer questions honestly. Depending on your children’s ages, it may not be appropriate to give them all the details, but do be truthful.
• Let them know what to expect. For example, let them know that after surgery you will need a lot of rest and may need to stay in the hospital. If your chemotherapy may cause you to lose your hair, let them know. Keep your children in the loop as much as possible.
• Explain to your children, especially younger children, that they cannot “catch” cancer.
• Let your children know that it is okay to cry or be upset. This may be especially important for your teens to hear.
• Tell teachers, babysitters, and others with responsibilities with and around your kids about your diagnosis in case they see behavior changes you may need to know about.
• Maintain normal schedules as much as possible.
• Let your kids help. Allow them to help with chores, and let them know that their help is important. Teens may want to take an active caregiver role. Let them do so, at appropriate levels.
• Look for support groups in your area. Many places offer support groups for children and teens whose parents have a cancer diagnosis.
• Know when to seek professional help. If your child begins to demonstrate unusual behavior such as angry outbursts, nightmares, or poor grades in school, ask your healthcare team for a recommendation for a counselor.

With Family and Friends

You may choose to keep your cancer journey private, or you may choose to share your story with others. The choice is yours. Remember when family, friends, coworkers, or other acquaintances ask about your diagnosis, they are genuinely concerned about your well-being. You can share with them as much or as little information as you like. These suggestions may help you talk about your diagnosis:

• Decide how much information you want to share before you start telling people about your diagnosis.
• If you chose to keep your journey private, make sure to let people know that you appreciate their concern, but you hope they respect your privacy.
• Choose someone close to you, like your caregiver, to spread the word about updates and treatment progress. After a long day of treatment, you may not feel like calling and texting people, but your friends and family will probably want to know how you are.
• If you want to share your story, consider starting an email chain or a Facebook group. This way you can update everyone with one message instead of needing to answer a lot of emails and phone calls.
  • You can also create your own private website at MyLifeLine.org.
• When people offer to help with things, let them. Your family and friends could cook dinner, drive you to an appointment, or babysit.
• If you lose your hair due to treatment or have visible surgical scars, strangers may ask about your diagnosis. Have a response prepared. Again, you may share as little or as much as you like.
If you or someone you know has just been diagnosed with cancer, you may have a lot of questions. In the next few pages, you will find basic information about cancer and questions to ask your healthcare team.

Understanding Gallbladder Cancer

To understand gallbladder cancer, it’s first important to understand what cancer is: basically, the production of abnormal cells.

The body is programmed to routinely replenish cells in different organs. As normal cells age or get damaged, they die off. New cells take their place. This is what’s supposed to happen. Abnormal cell growth refers to a buildup of extra cells. This happens when:

- New cells form even though the body doesn’t need them or
- Old, damaged cells don’t die off.

These extra cells slowly accumulate to form a tissue mass, lump, or growth called a tumor. These abnormal cells can destroy normal body tissue and spread through the bloodstream and lymphatic system.

Understanding Gallbladder Cancer

There are almost 10,000 cases of gallbladder cancer diagnosed each year. Only about 1 of every 5 cases is found at an early stage.
Almost all gallbladder cancers start in the tissue on the inside wall of your gallbladder. As time passes, the cancerous cells grow deeper into the gallbladder wall. They push through the layers of your gallbladder.

To understand gallbladder cancer, it’s helpful to understand the organ itself. The gallbladder has several layers:

- The epithelium: thin sheet of cells closest to the inside of the gallbladder
- The lamina propria: a thin layer of loose connective tissue
- The muscularis: a layer of muscular tissue that helps the gallbladder contract, releasing its bile into the bile duct
- The perimuscular: fibrous connective tissue
- The serosa: the outer covering of the gallbladder

Ninety percent of all gallbladder cancers are adenocarcinomas.

To better understand what an adenocarcinoma is, let’s look at the word. *Adeno* means gland. *Carcinoma* is a malignant tumor.

Although these tumors are malignant, they all generally start from adenomas. These are polyps that are not cancerous. The bigger the adenoma is, the more likely it is to become cancerous.

Six percent of all gallbladder cancers are papillary adenocarcinomas. These are also known as papillary cancer. These cancers have a better prognosis because they’re not as likely to grow into the liver or lymph nodes. A pathologist who looks at the cells in your gallbladder can spot a papillary adenocarcinoma because they cells are arranged in finger-like projections.

If it grows through the gallbladder wall, the tumor can invade nearby organs, such as your liver. Or it can enter the lymphatic or blood vessels in the gallbladder wall. This enables the cancer to spread to lymph nodes, liver, and other body parts.

**The Diagnosis**

Only one out of five gallbladder cancers are found before they have spread to other tissues and organs. Gallbladder cancer is hard to detect because the gallbladder is located deep inside your body. This makes it hard to feel or see during an examination.

There are no blood tests to reliably detect gallbladder cancer. For this reason, gallbladder cancer is usually found only when the cancer has grown enough to cause symptoms. In some people, gallbladder cancer is discovered after the gallbladder has been removed to treat gallstones or inflammation of the gallbladder.

Because gallbladder cancer cells can be difficult to find, your doctor may use a variety of tests to diagnose your cancer:

**Medical exam.** The first step in diagnosis is to do a physical exam and take your complete medical history. If gallbladder cancer is suspected, your doctor will check:

- Your abdomen for masses, tenderness, or fluid buildup
• Your skin and the whites of your eyes for a yellowish color that would suggest jaundice
• The skin on your collarbone for lumps that could indicate cancerous cells in your lymph nodes

If the physical exam and/or symptoms suggest you might have gallbladder cancer, your doctor will order more tests. Below is an overview of the possible tests.

**Blood tests:** Your doctor will be looking for the amount of bilirubin in your blood. This is the chemical that gives bile its yellow color. If you have problems in your gallbladder or liver, the level of bilirubin may increase. This is what can cause yellow skin or eyes.

Your doctor will be testing your blood for other substances, such as:

- Albumin
- Alkaline phosphatase
- AST
- ALT
- GGT

Any of these may be abnormally high if you have liver or gallbladder disease.

**Tumor markers:** These are proteins found in the blood when specific cancers are present. CEA and CA 19-9 are tumor markers for gallbladder cancer. High levels of these substances in your blood can indicate gallbladder cancer. However, keep in mind that other cancers or health conditions can cause the CEA and CA 19-9 levels to be high.

**Imaging tests:** These use X-rays, magnetic fields, or sound waves to create pictures of the inside of your body. Your doctor may want an imaging test to:

- Help find a suspicious area that might be cancerous
- Help a doctor guide a biopsy needle into a suspicious area to take a sample
- Learn how far cancer may have spread
- Help guide certain types of treatments
- Help determine if treatment has been effective
- Look for a possible recurrence of the cancer

An **ultrasound** is usually the first imaging test done. This test uses a small instrument called a transducer. It is shaped like a wand. The transducer sends out sound waves. The sound waves bounce off your internal organs, and the transducer picks up their echoes. A computer converts these echoes into a black and white image that is displayed on a screen. Most tumors release echoes that are different from normal tissue echoes. Your doctor can use this pattern of echoes to help locate tumors. Also, he or she can figure out how far the tumors may have grown or spread.

An ultrasound uses no radiation. You lie down on a table, and your skin is lubricated with gel. Then the doctor or technician moves the transducer along the skin over your upper right abdomen.
Endoscopic or laparoscopic ultrasound: These special kinds of ultrasounds put the ultrasound transducer inside your body. This puts it closer to your gallbladder, and the doctor can get more detailed pictures.

Here’s how it works. The transducer is on the end of a thin, lighted tube. This tube has an attached device called an endoscope or laparoscope. Your doctor will put the tube through your mouth and down your stomach. It will reach near your gallbladder. A laparoscopic ultrasound requires a surgical cut in your belly for the transducer to be inserted.

If your doctor finds a tumor, the ultrasound will tell if the tumor has invaded your gallbladder wall. If it has, then the ultrasound will tell how far.

CT scan (CAT scan or computed tomography): The CT scan is an X-ray test that produces detailed pictures of your body. Instead of taking one picture, like a regular X-ray does, a CT scanner takes many pictures. It does this by rotating around you while you lie on a table. Then a computer combines all these images. That produces a 3-dimensional picture of the part of your gallbladder.

Before any pictures are taken, you may have to drink 1 to 2 pints of a liquid. It is called oral contrast. This fluid helps outline your intestine. This helps the doctor identify tumors. You may also receive an IV (intravenous line) in your arm or hand. A different type of contrast dye can be injected through the IV. Its purpose is also to outline structures in your body.

The injection may make you feel flushed or warm. It is a little uncomfortable, but not painful. Many patients say that having to lie still is difficult. CT scans can:

- Identify tumors in the gallbladder region.
- Show organs near the gallbladder to check for cancer spread.
- Show lymph nodes that the cancer might have spread to.
- Be used to guide a biopsy needle precisely into a suspected tumor. This procedure is called a CT-guided needle biopsy. In this procedure, the radiologist puts a biopsy needle through your skin and into the mass. Then a tissue sample is removed and examined under a microscope.

A special type of CT known as CT angiography can be used to look at the blood vessels near your gallbladder. This tells your doctor if surgery is a good option.

MRI (magnetic resonance imaging): An MRI scan provides detailed pictures like CT scans. The difference is that MRI scans use radio waves and strong magnets instead of X-rays. The energy from the radio waves produces patterns. A computer takes these and turns them into detailed images of specific parts of your body.

MRI scans are helpful in looking at your gallbladder and nearby bile ducts and other organs. Sometimes they can help tell a benign tumor from a malignant one.

There are 2 special kinds of MRIs used to diagnose gallbladder cancer:

- MR cholangiopancreatography (MRCP) is used to look at the bile ducts.
- MR angiography (MRA) is used to look at the blood vessels.
MRI scans are often little more uncomfortable than CT scans. For one thing, an MRI takes up to an hour. You may be placed inside a narrow tube. This can feel confining. There are newer, open MRI machines in many hospitals and clinics around the country.

**Cholangiography:** Another type of imaging test is a cholangiogram. This test looks at the bile ducts to see if they are blocked, dilated, or narrowed. A cholangiogram is often used to plan a surgery. There are 3 types of cholangiograms:

- **Magnetic resonance cholangiopancreatography (MRCP):** This uses a standard MRI machine. It does not require an IV of a contrast agent.
- **Endoscopic retrograde cholangiopancreatography (ERCP):** In an ERCP, your doctor puts a long, flexible tube called an endoscope down your throat. The tube goes through your esophagus and stomach and into the first part of your small intestine. A small tube goes from the end of the endoscope into the common bile duct. A small amount of contrast dye is injected through this tube. This fluid outlines the bile and pancreatic ducts. Then X-rays are taken. These images can reveal narrowing or blockage of the bile ducts. The benefit to an ERCP is that your doctor can take samples of cells or fluid.
- **Percutaneous transhepatic cholangiography (PTC):** In a PTC, your doctor puts a thin needle through the skin of your abdomen and into a bile duct in your liver. You will be given an IV line before the procedure. You’ll be given medicine to make you sleepy through the IV. Your doctor will also rub a local anesthetic on your abdomen to numb it. A contrast dye will be injected through the needle. As this fluid travels through the bile ducts, X-rays are taken. This procedure may cause more pain. For this reason, PTC is not typically used unless ERCP has already been tried or can’t be done.

**Angiography:** This X-ray test looks at blood vessels. A small amount of contrast dye is injected into an artery. This outlines blood vessels while X-ray images are taken. These images show doctors if blood flow in an area is blocked. These X-rays also show any abnormal blood vessels in the area. Angiography can show whether a gallbladder cancer has grown through the walls of blood vessels. All this information helps your surgeon decide if a cancer can be removed.

In this procedure, the radiologist puts a small, flexible tube (called a catheter) into the artery leading to your gallbladder. Contrast dye is injected through this tube. A local anesthetic is used to numb the area before the catheter is inserted. Then the dye is quickly injected to outline all the vessels. This procedure can be uncomfortable.

**Laparoscopy:** In this test, the doctor inserts a thin tube with a light and a small video camera on the end. This instrument is called a laparoscope. It is inserted through a small incision (cut) in the front of your abdomen. This device enables your doctor to look at your gallbladder, liver and other organs. This test is done in the operating room. You will be given general anesthesia.

Laparoscopy can help your doctor plan your surgery or other treatments. It is also useful in determining how advanced your gallbladder cancer is.

Laparoscopy is often used to remove the gallbladder to treat gallstones or chronic inflammation of the gallbladder. This operation is called a *laparoscopic cholecystectomy.* Sometimes the surgeon finds or suspects gallbladder cancer during that operation. If this
happens, the surgeon will do an open cholecystectomy. This is also a removal of the gallbladder but it involves a larger cut in your abdomen. This opening lets the surgeon see more. It can reduce the change of releasing cancer cells into your abdomen.

**Biopsy:** This common surgical procedure is the removal of a sample of tissue. That sample is then looked at under a microscope. For most types of cancer, a biopsy is needed to diagnose cancer. A biopsy also helps your doctor determine if your cancer has spread. In the case of gallbladder cancer, though, a biopsy is not always done before surgery to remove the tumor. There is concern that sticking a needle into the tumor will disturb it. This can cause the tumor to release cancer cells that can spread.

If imaging tests (ultrasound, CT or MRI scans, cholangiography, etc.) show there is a tumor in the gallbladder, your doctor may want to operate immediately. Once the gallbladder is removed, the gallbladder tissue is examined under a microscope.

In other cases, a doctor may feel that a biopsy is the best way to know for sure whether you have gallbladder cancer.

**Types of Biopsies**

There are several ways to take biopsy samples of the gallbladder.

- Collecting a sample of bile during an ERCP or PTC
- Taking a sample during laparoscopy
- Performing a needle biopsy—this type of biopsy is used if the cancer appears too advanced for surgery. In a needle biopsy, a thin, hollow needle is inserted through your skin and into the tumor. Your skin will be numbed ahead of time with a local anesthetic. The needle is usually guided by ultrasound or CT scans. When the images show that the needle is in the tumor, a sample is drawn into the needle. This sample is then examined under a microscope.

Usually this is done as a fine needle aspiration (FNA) biopsy. FNA uses an extremely thin needle that is attached to a syringe. Or it can be done as a core needle biopsy, which uses a slightly larger needle.

**Stages of Gallbladder Cancer**

Once gallbladder cancer has been diagnosed, it’s important to know what stage of cancer you have. Knowing what stage your cancer is tells you how serious it is. The stage of gallbladder cancer depends on the size of the cancer, lymph node involvement and if there is any spread of the tumor. It helps your doctor plan the right course of treatment.

The TNM staging system is used for all types of cancer, not just gallbladder cancer. The letters TNM describe the amount and spread of cancer in your body.

- **T:** indicates how big the tumor is
- **N:** indicates number of lymph nodes with cancer cells in them
- **M:** indicates metastasis, which means that cancer has spread to other body parts
The most common places for gallbladder cancer to spread are the:

- Liver
- Peritoneum (lining of your abdomen)
- Lungs

Stages are usually often labeled using Roman numerals 0 through IV (0-4). Higher numbers mean cancer has spread and the cancer is more advanced.

Besides knowing the stage of gallbladder cancer you have, it's important to know the grade. Your doctor gives the cancer cells a grade. This grade is based on how much they look like normal gallbladder tissue under a microscope. The scale goes from G1 (cancer looks like normal gallbladder tissue) to G4 (cancer looks very abnormal)

**How Cancer Spreads**

Generally speaking, low-grade cancers are less likely to grow and spread. There are 3 main ways that cancer spreads in your body. It can spread through:

- **Tissue.** Cancer invades nearby normal tissue.
- **Lymph system.** Cancer invades your lymph system and travels through your lymph vessels to other parts of your body.
- **Blood.** Cancer invades your veins and capillaries and travels through your bloodstream to other parts of your body.

The original tumor is called the primary tumor. When cancer cells break away from it and travel to other places in your body, a secondary tumor can form. The name for this spreading process is metastasis.

The secondary tumor is the same kind of cancer as the primary tumor. For instance, if the cancer cells in your gallbladder travel to your liver, it is called metastatic gallbladder cancer. It is not liver cancer.

**Choosing an Oncologist and Treatment Center**

If you’ve been diagnosed with cancer, it’s important to explore all options related to gallbladder cancer treatment. Below, learn what’s next, what questions to ask the doctor, and what treatments are available.

**Finding an Oncologist**

The first step on the cancer treatment journey is to find an oncologist (medical or surgical) who inspires trust. You may want to discuss this with your nurse navigator. It may seem overwhelming to choose an oncologist. First, start with referrals from your primary care physician, specialist, or insurance carrier. Talk to family and friends who may have recommendations.

Here are some things to consider when choosing an oncologist:
• Is the oncologist board certified?
• How much experience does he or she have in treating gallbladder can cancer?
• Do you feel comfortable talking with this doctor? Does he or she listen well?
• Is the staff compassionate? Is the environment a good one or do you feel rushed?
• What hospital(s) does this oncologist see patients in?
• What are the office hours?
• What if you have an emergency? Can you call?
• Can this doctor be contacted after hours?

You will be spending a lot of time with the oncologist and nurses and technicians, so it’s important to feel comfortable with them.

Choosing a Cancer Center

Choosing where to receive treatment is just as important as selecting an oncologist. It’s good to know the differences between hospitals. Here are some guidelines:

• Academic cancer centers: These are affiliated with medical schools. At these locations, high priority is put on research. They are usually located in large cities.
• Community cancer centers: The main focus is on patient care.
• Cancer centers: These are noted for a high quality of science and research.

Some questions to ask before choosing where to get your treatment include:

• Volume: How many gallbladder surgeries does the surgeon do annually?
• Travel: How far do you want to travel? Would there be extra costs?
• Cost: Is the hospital covered by your insurance plan?
• Accreditations: What accreditations does the hospital hold?

Questions for Your Healthcare Team

If you’ve just been diagnosed with cancer, you may be confused and overwhelmed. You probably want answers, but you may not even know what questions to ask. As a cancer patient, being able to talk openly and honestly with your healthcare team is very important.

When you first meet with your doctor, it can be helpful to bring someone else with you. That way, there’s someone else to hear what is said and to ask questions. Here are some other tips for talking with your doctor:

• Write out your questions ahead of time.
• Write down the answers your doctor gives you.
• If you don’t understand something, ask your doctor to say it in a different way. It’s important that you understand, and you have a right to know.

Use these must-ask questions as a guide to start talking with your healthcare team.
What is my diagnosis?
This question may seem like a no-brainer, but in the rush of appointments, you may not receive a clear answer. If you are unsure of your diagnosis, ask your oncologist. Sometimes more specific tests are needed to make an exact diagnosis.

What is my prognosis? What stage is my cancer?
Knowing your prognosis can help you better prepare for the future and select your best treatment plan. In order to know the stage of your cancer, your doctor will need to do tests. These may include scans, genetic testing, and/or a biopsy. The answer to these questions may be difficult to hear. You may consider having a family member or friend with you at this appointment.

What are my treatment options? What would you recommend?
Ask your oncologist to explain all your treatment options, including possible side effects and cost. Ask your oncologist which treatment he or she recommends. Also, ask your doctor what the goal of your treatment is—palliative or curative. If you are unsatisfied with your options, do not be afraid to seek a second opinion.

Am I eligible for a clinical trial?
Clinical trials help improve the standard of care for all cancer patients. Based on your situation, a clinical trial may also be your best treatment option. Each trial has its own eligibility requirements.

What are the possible short-term and long-term side effects of treatment? How will these affect my normal activities?
Always ask about short-term and long-term side effects before beginning treatment so you are prepared. You should also consider short-term and long-term side effects when deciding which treatment plan is best for you.

How can I manage these side effects?
Some side effects can be easily managed through diet, exercise, or over-the-counter medication. Other side effects may require prescription medication, occupational therapy, or physical therapy which your oncologist can prescribe as needed. See the “Side Effects Management” section of the Handbook.

Will my ability to have children be affected? Is there anything I can do to preserve my fertility?
Some cancers and cancer treatments can affect your fertility, but you do have options. Before treatment, you may be able to freeze eggs or bank sperm. There may be steps you can take during treatment to protect your reproductive system as well. For more information, visit Fertile Hope at http://www.fertilehope.org/.

How can I keep myself as healthy as possible during treatment?
Your own immune system plays a big part in your fight against cancer. It is important to stay as healthy as possible while undergoing cancer treatment.

Where can I find help with financial concerns?
Evaluate your financial situation as soon as possible. You will not want to deal with financial stress in the middle of treatment when you may not feel well.
Where can I find help with lodging or transportation?
When beginning cancer treatment, planning ahead is key. Some treatment centers have lodging coordinators or social workers to help you with the logistics of treatment. Ask your nurse navigator for assistance if you are having trouble finding lodging or transportation. See the “Finding Transportation” and “Finding Lodging” sections of the Handbook.

What will my follow-up care plan include?
After you finish treatment, make sure you and your oncologist create a follow-up care plan. You will need to check for recurrence. You may also need follow-up care for long term side effects.

When can I call myself a survivor?
According to the National Cancer Institute’s definition of a cancer survivor, “a person is considered to be a survivor from the time of diagnosis until the end of life.”

Treatment Options
It’s helpful to understand the possible treatments for gallbladder cancer. The following are overviews of the most common treatments for gallbladder cancer. Reading these should help you know what to expect, what the potential side effects are, and what the advantages are to each.

The main treatments for gallbladder cancer are:

- Surgery
- Radiation
- Chemotherapy
- Palliative Therapy

Surgery
Most doctors agree that surgery offers the best chance for curing gallbladder cancer. However, doctors disagree about whether advanced gallbladder cancers can be treated with surgery. Gallbladder cancer surgery is very complex. These surgeries may not be available in every community.

Even if the cancer has spread far beyond your gallbladder, surgery may still be an option. If the cancer has spread into major blood vessels, though, surgery may not be effective.

There are 2 types of surgeries for gallbladder cancer:

- **Potentially curative surgery** is done when imaging tests show there is a good chance the surgeon will be able to remove all the cancer. The term resectable describes cancers that can be removed completely. Unresectable describes cancers that have spread too far or are in a difficult place and can’t be entirely removed.
- **Palliative surgery** is done to relieve pain and prevent complications. This surgery is not expected to cure the cancer. It can help relieve your symptoms and prolong life.
You should discuss surgery with your doctor. Surgery to remove gallbladder cancer is complex and can have a lot of side effects. It also may take several weeks to recover. If your cancer is not curable, you may want to weigh the benefits and risks of surgery.

Let’s look at each of the different types of surgeries:

**Staging laparoscopy:** This surgery is often done before any other surgery. It helps identify how advanced the cancer is. It also shows whether it can be removed completely (resectable). Laparoscopy also helps the surgeon find cancerous areas that imaging tests couldn’t find.

In this procedure, a small cut is made. Then a long, lighted tube called a laparoscope is inserted into your abdomen. Your doctor uses the laparoscope to look around your abdomen. He or she will be looking for signs that cancer has spread. If the cancer is resectable (removable), laparoscopy can help plan the operation.

**Cholecystectomy:** The operation to remove the gallbladder is called a *cholecystectomy*. If just the gallbladder is removed, the operation may be called *simple cholecystectomy*.

This operation is often used to remove the gallbladder for other reasons such as gallstones. However, this procedure is not done if gallbladder cancer is suspected. A simple cholecystectomy can be done in 2 ways:

- **Laparoscopic cholecystectomy:** This is the most common way to remove a gallbladder. This method is used for conditions like gallstones. This procedure uses a laparoscope. This is a thin, flexible tube. It has a tiny video camera on the end. The laparoscope is inserted through a small cut in the skin of your abdomen. Long surgical tools are placed through several other small openings to remove the gallbladder. The benefit of laparoscopic surgery is that the incision size is small.

- **Open cholecystectomy:** In this procedure, the surgeon removes your gallbladder through a large incision (cut) in your abdomen. This method is sometimes used if a non-cancerous gallbladder problem is suspected (such as gallstones), which in some cases may lead to the discovery of gallbladder cancer. But if gallbladder cancer is suspected before surgery, doctors prefer to do an extended cholecystectomy.

**Extended (radical) cholecystectomy:** In most cases of gallbladder cancer, an extended (or radical) cholecystectomy is done. This is a very involved, complex surgery. An extended cholecystectomy removes at least:

- Your gallbladder.
- About an inch or more of liver tissue next to the gallbladder.
- All of the lymph nodes in the region.

Your surgeon may also find it necessary to remove:

- More of your liver
- The common bile duct
- Part or all of the ligament that runs between your liver and intestines
- Lymph nodes around your pancreas, around the major blood vessels leading to the liver, and around the artery that brings blood to your small intestine and pancreas.
- Your pancreas
- The duodenum (the first part of the small intestine into which the bile duct drains
- Any other areas of organs to which cancer has spread.

**What to Expect**

For any of these surgeries, you will be given anesthesia so you are asleep and not in any pain during the procedure.

Laparoscopic cholecystectomy is the least invasive operation. It tends to have fewer side effects. You will probably have some pain from the incisions for a few days. This pain can be managed with medications. There is more pain and a longer recovery time with an open cholecystectomy.

Extended cholecystectomy is a major operation and involves removing parts of several organs. Most of these organs are involved in digestion. That makes eating difficult for a while after surgery.

**Radiation**

Radiation therapy uses high-energy rays (like X-rays) to destroy cancer cells. There are different kinds of radiation therapy:

- External-beam radiation therapy (EBRT) uses X-rays or particles from a machine outside the patient's body to kill cancer cells.
- Brachytherapy (internal radiation therapy) uses small pellets of radioactive material placed next to or directly into the cancer.

**External beam radiation therapy** is the most common form of radiation therapy for gallbladder cancer. The treatment is much like getting an X-ray. However, the radiation is stronger. The procedure itself is painless. Each treatment takes only a few minutes. Most often, radiation treatments are given 5 days a week for several weeks.

**Standard (conventional) EBRT** is used much less often than in the past. Standard EBRT delivers more exposure to nearby healthy tissues. That’s why doctors prefer another approach.

**Three-dimensional conformal radiation therapy (3D-CRT):** 3D-CRT is a type of external beam radiation therapy that uses special computers to precisely map the location of the tumor(s). Radiation beams are shaped and aimed at the tumor(s) from several directions. This makes it less likely to damage normal tissues. Most doctors now recommend using 3D-CRT when it is available.

Radiation therapy may be used to treat gallbladder cancer in several ways:

**After surgery:** Radiation may be used to destroy cancer cells that were left behind after surgery because it was too small to see. This is known as *adjuvant therapy*. Radiation therapy is often given along with chemotherapy drugs such as 5-fluorouracil (5-FU) or capecitabine, which may make the radiation more effective. Giving chemotherapy and radiation together is
called chemoradiation. Some studies have shown that giving chemoradiation after surgery may help patients live longer, especially those whose cancer had spread to lymph nodes.

**As part of the main therapy for some advanced cancers:** Radiation therapy can also be used as a main therapy for some patients whose cancer is not resectable. Radiation is only effective if the cancer has not spread widely. Most often radiation is given along with chemotherapy. This combination is called chemoradiation. This treatment does not cure the cancer, but it may help patients live longer and with better maintained quality of life.

**As palliative therapy:** Radiation therapy is often used to help relieve symptoms if the cancer is too advanced to be cured. It may be used to relieve pain or other symptoms by shrinking tumors that are blocking passageways or are pressing on nerves.

Side effects of radiation can include:

- Redness and tenderness of the skin
- Nausea
- Diarrhea
- Fatigue

These side effects usually go away after treatment.

**Chemotherapy**

Chemotherapy treatment (usually called “chemo”) is the use of drugs that prevent cancer cells from growing and spreading. Chemotherapy medicines either destroy cancer cells altogether or stop them from dividing. Chemotherapy affects your whole body because it goes through your bloodstream. Chemo doesn’t refer to one treatment but many, because there are lots of different chemotherapy medicines.

Chemotherapy may help some people with gallbladder cancer, but most studies have found its effectiveness against this type of cancer is limited.

For gallbladder cancers that are resectable, chemotherapy may be used after surgery (often along with radiation therapy) to try to lower the risk that the cancer will return. This is called *adjuvant treatment*. Doctors aren’t yet sure how useful it is in the treatment of gallbladder cancer.

Chemotherapy may also be used (with or without radiation therapy) for more advanced cancers. Chemotherapy does not cure these cancers, but it may help shrink or slow the growth of tumors for a time. This may help relieve symptoms from the cancer, and may help people live longer.

Doctors give chemotherapy in cycles, with each period of treatment followed by a rest period to allow the body time to recover. Chemotherapy cycles generally last about 3 to 4 weeks. Chemotherapy is often not recommended for patients in poor health, but advanced age by itself is not a barrier to getting chemotherapy.
What to Expect
Chemotherapy not only weakens and destroys cancer cells at the site of the tumor, but throughout the body as well. Unfortunately, this means that chemo can unintentionally harm the development of normal cells like your hair, nails, mouth, and digestive tract.

The side effects chemo causes depend on the type of chemotherapy you receive and how many cycles you receive. The most common side effects of chemo are:

- Nausea and vomiting
- Fatigue or tiredness
- Confusion, forgetfulness (“chemo brain”)
- Decreased blood counts, sometimes with bruising, bleeding, or infection
- Sores inside your mouth
- Numbness in your hands and feet
- Diarrhea, loose stool
- Increased urgency to have a bowel movement or urinate

When chemotherapy is given at a lower dose, these side effects are less common. This sometimes happens when radiation is necessary too. If you experience side effects, call your physician right away. It is better to address side effects right away, and there are numerous drugs available to help manage side effects.

How You Receive Chemo
Chemo medicines come in different forms and can be given in different ways:

- Intravenously (IV): As an infusion, the medicine comes through a thin needle (IV) in a vein in your hand or lower arm. An oncology nurse will insert the needle before each infusion and take it out afterwards.
- Injection: As a single shot into a muscle in your leg, arm, hip, or under the skin in the fatty part of your stomach, leg or arm.
- By mouth: As a pill or capsule. You may take this yourself at home.
- Through a port: This is inserted in your chest during a short outpatient surgery. It is about the size of a quarter and sit right under your skin. A port is a small disc made of plastic or metal. A catheter (soft thin tube) connects the port to a large vein. The chemo medicines are delivered through a thin needle right into the port. You can also get your blood drawn through the port. Once you have finished chemo, the port is removed in a brief outpatient procedure.
- Through a catheter in your chest or arm: This is a soft thin tube that is inserted into a large vein. This is done in a short outpatient surgery. The other end of the catheter stays outside your body. This is similar to having a port.
- Hepatic artery infusion: A new chemo approach involves giving the chemo directly into the hepatic artery. This is called hepatic artery infusion or HAI. The hepatic artery supplies most gallbladder tumors. Your healthy liver then removes most of the remaining drug before it can reach the rest of the body. This can reduce the possible chemo side effects. HAI may help some people whose cancer was not removable by
surgery. HAI does involve a surgery to insert a catheter into the hepatic artery. Some gallbladder cancer patients may not be able to tolerate this surgery.

Setting Your Schedule
Your oncologist will set your treatment regimen. Every chemo regimen is made up of cycles. This means a period of treatment followed by a period of recovery. For example, you may get chemo one day and then have a few weeks of recovery with no treatment. That would be one cycle. Or you may get chemo for several days in a row and then have a recovery period. Several cycles make up a complete chemotherapy regimen.

The number of cycles in a regimen and the length of each regimen vary from patient to patient. A lot depends on the medicines used. However, most regimens take 3 to 6 months to complete. A typical routine is treatment every 3 weeks.

You can get chemotherapy in a variety of settings: at a hospital, in a doctor’s office, or in a clinic. You may even get chemo at home if you are taking chemo in a pill form or you have a portable pump.

If you take chemo in a clinic, hospital or doctor’s office, you usually go home between treatments. In some cases, you may stay in the hospital to be monitored. This is especially true if your immune system isn’t working as well as it should be. Your doctor will explain where you’ll be getting your treatment.

Passing Time During Chemotherapy
A chemotherapy treatment at a hospital or clinic can take anywhere from one to several hours. Although many chemo treatment areas have televisions and magazines, you may want to bring something to help pass the time. Ideas include:

- A laptop
- Knitting, needlepoint or crochet
- A thick novel
- Crossword or other puzzle book
- Sketchbook and pencils
- Cards or board games (if you have someone to play with)
- MP3 or portable CD player to listen to music
- Paper and pens to keep a journal or write letters

Planning Ahead for Chemotherapy
Chemotherapy treatment can drain most of your energy. This is a major process your body is going through. There are some things you should take care of before you start chemo:

- Get your teeth cleaned and get a dental check-up. Chemo weakens your immune system, so you may be more vulnerable to infections caused by bacteria that are dislodged during teeth cleaning.
- Get any heart tests (like an EKG) that your doctor recommends.
- If you’re a woman, get a Pap smear, if you’re overdue. Chemo can alter the results of your Pap smear, so get one beforehand.
• Find someone to help around the house. Chemo causes extreme fatigue. Line up someone to help with your daily chores: cleaning, grocery shopping, carpooling, and cooking to name a few. Don’t be too proud or stoic to ask for help. Friends and family members will be happy to do something that helps you during this treatment phase. Ask yourself: wouldn’t you be willing to do it for someone else?
• Join a support group if that sounds helpful.
• Find out ahead of time what you should and shouldn’t eat or drink on treatment days.
• Tell your doctor all the vitamins, supplements, over-the-counter and prescription medicines you take.
• Talk to your doctor about hair loss. Most chemo medicines cause some amount of hair loss. If you plan on wearing a wig, you might want to go ahead and get it so you can match it to your hair color and style.

Drugs Used To Treat Gallbladder Cancer
Several chemo drugs are commonly used to treat gallbladder cancer:

- Gemcitabine (Gemzar®)
- Cisplatin (Platinol®)
- 5-fluorouracil (5-FU)
- Capecitabine (Xeloda®)
- Oxaliplatin (Eloxatin®)

In some cases, 2 of these drugs may be combined to try to make them more effective. When chemo is given with radiation, most often 5-FU or capecitabine is used.

Possible Side Effects
Chemotherapy drugs work by attacking cells that are dividing quickly, which is why they work against cancer cells. But other cells in the body, such as those in the bone marrow, the lining of the mouth and intestines, and the hair follicles, also divide quickly. These cells are also likely to be affected by chemotherapy, which can lead to side effects.

The side effects of chemotherapy depend on the type and dose of drugs given and the length of time they are taken. These side effects can include:

- Hair loss
- Mouth sores
- Loss of appetite
- Nausea and vomiting
- Diarrhea
- Increased chance of infections (from low white blood cell counts)
- Easy bruising or bleeding (from low blood platelet counts)
- Fatigue (from low red blood cell counts)

Palliative Therapy

Palliative therapy is treatment given to help control or reduce symptoms caused by advanced cancer. It does not try to cure the cancer. If the cancer has spread too far to be completely
removed by surgery, your doctor may recommend one of several palliative therapies. The following are explanations of several palliative therapies.

**Biliary Stent or Biliary Catheter**

Often cancer is blocking a duct that carries bile from your gallbladder to your small intestine. This can cause jaundice and other problems. Your doctor may insert a small tube (either a *stent* or a *catheter*) into the bile duct or gallbladder to help the bile drain out. This may be done as part of a cholangiography procedure or surgically.

- A stent is a small metal or plastic tube that keeps the duct open. This allows the bile to drain into your small intestine.
- A catheter is a thin, flexible tube that drains into a bag outside your body. The bag can be emptied when needed. If you have a catheter, your doctor or nurse will teach you how to care for it.

The stent or catheter may need to be replaced every few months.

**Biliary Bypass**

If you are healthy, another option may be to use a surgery called biliary bypass to drain bile from your liver and gallbladder. This operation creates a new way for bile to get past the blockage in the bile ducts.

There are several different biliary bypass operations. Your doctor will recommend the best one to use, based on where the blockage is.

- A *choledochojejunostomy* joins the common bile duct to the jejunum (the second part of the small intestine).
- A *gastrojejunostomy* joins the stomach directly to the jejunum.
- A *hepaticojejunostomy* joins the duct that carries bile from the liver to the jejunum of the small intestine.

Sometimes these operations can be done through several small holes made in the abdomen using special long surgical tools. This is known as *laparoscopic* or *keyhole surgery*. A biliary bypass is a major operation. That’s why it is important that you are healthy enough to withstand it. You should also talk to your doctor about the possible benefits and risks.

**Alcohol injection**

To relieve pain, doctors may deaden the nerves that carry sensations of pain from your gallbladder and intestinal area to the brain by injecting these nerves with alcohol. This can be done during surgery or by guiding a long, hollow needle into place with the help of a CT scan.

**Pain medicines**

Doctors can prescribe strong pain-relieving drugs if needed. It's important to let your cancer care team know if you are having pain so it can be treated effectively.
Clinical Trials

Clinical trials are medical research studies that test new ways to prevent, screen, diagnose, or treat a disease. Cancer clinical trials determine if a treatment shows an improved way of caring for patients. Clinical trials improve cancer care for all. Talk to your doctor about clinical trials. Depending on your specific diagnosis, a clinical trial may be your best treatment option.

All About Cancer Research

Cancer research involves very highly trained doctors and scientists trying to figure out how cancer works. Research is always done by a set of rules, called “the scientific method” that ensures the information will be valid. Researchers begin by looking for answers to questions like these:

- What causes cancer?
- What makes cancer cells keep growing?
- What destroys cancer cells?
- What stops cancer cells from growing?

By studying how cancer cells behave in animals, researchers can develop theories, or ideas, about potential treatments for humans with cancer. Once a treatment is ready to be tested on humans, researchers conduct clinical trials.

What are clinical trials?

A clinical trial is a medical research study that tests new ways to prevent, screen, diagnose, or treat a disease. The word “clinical” means related to examining and treating patients.

Cancer clinical trials help to determine if a treatment, drug, or procedure shows a better way of treating a particular cancer, or provides a way to treat a condition for which there wasn’t a treatment before.

It takes years of thought and planning to have a clinical trial accepted by the U.S. Food and Drug Administration (FDA). The FDA must approve the trial before researchers can recruit patients. Clinical trials allow patients access to the latest research treatments before they are available to the public.

Who sponsors clinical trials?

Medical or research institutions, pharmaceutical and biotechnology companies, the government, and nonprofit groups who want to improve current cancer treatment can all sponsor clinical trials. Some trials are "investigator initiated," which means a researcher or doctor created the trial, but these trials face the same strict requirements.
What do the phases of clinical trials mean?

**Phase I** trials answer the questions: Is the drug or treatment safe? What is a safe dose? What are the side effects? Phase I trials are small, each only involving 20-80 participants. These trials are usually the first time a drug or treatment has been tested in humans.

**Phase II** trials tell researchers if the drug or treatment is effective in a larger group (100-300 participants) and help identify safety concerns.

**Phase III** trials determine within a large group (1,000 – 3,000 participants) if the experimental drug or treatment works better than what is currently used and if there are additional side effects. Most Phase III trials are randomized, meaning some participants will receive the experimental drug or treatment while others will receive the standard drug or treatment currently accepted by the medical community as best for their cancer type (standard of care).

**Phase IV** trials allow researchers to learn more about the drug or treatment and its risks, benefits, and best use.

Usually FDA approval comes after large phase III trials. However, sometimes special consideration is given to treatments that show great promise in early trials.

After enough data is gathered to prove that the new treatment is effective or more effective than current treatments, the FDA will investigate the findings and approve the treatment for use. After FDA approval, doctors can prescribe treatments to their patients without enrolling patients in clinical trials.

**For a participant, what happens in a clinical trial?**

Each clinical trial recruits and screens participants through participating treatment centers. In order to learn if a drug is effective, the participants must be similar in the type of diagnosis and other factors. Trials are designed to be very specific so researchers can know that the drug or treatment being studied is causing changes. For example, a clinical trial may be designed to answer a specific question, such as this: “Is this treatment effective for patients with gallbladder cancer who have already received surgery?”

Participants must be eligible in order to qualify for the trial. Some possible requirements for eligibility include:

- Cancer type
- Stage
- Specific tumor types or genetic markers
- Treatment history
- Age
- Other medical conditions

If you qualify for a trial, your healthcare team will provide you with all the information about the trial. They will tell you, in a process called informed consent, how the trial will be conducted and the possible risks and benefits of the trial. You will then sign a document stating that you understand the details of the trial and that you are willing to participate. Even after signing the document of informed consent, you may withdraw from the trial at any time for any reason.
The way you receive treatment depends on the specific clinical trial. Clinical trial treatments can come in many forms. These include but are not limited to the following:

- Intravenous (IV) medications given through a port or IV line
- Shots
- Oral medications
- Surgery
- Radiation

As with any cancer treatment, clinical trial treatments may come with side effects. Your healthcare team will help you manage these side effects. It is very important to report to your healthcare team any side effects that you experience. Part of what researchers are studying is how the treatment affects the whole body, not just the cancer cells.

**How is a clinical trial treatment different from other treatments?**

Patients who decide to participate in clinical trials receive excellent care and attention. Throughout the trial, your healthcare team will closely monitor you for improvements and adverse side effects.

Researchers want to control as much about your care as they can to make sure it is the treatment that is helping your cancer improve, and not something else. Because of this, you may have restrictions on what you can eat and what other medicines you can take.

Although you should always follow your treatment plan and not miss appointments, doing so is especially important with a clinical trial. Clinical trials must have consistency among the participants to know if the treatment really is working.

**Are clinical trials a “last resort” for cancer patients?**

Patients who are no longer helped by existing standard of care treatments may find that a clinical trial provides hope, but many patients begin their treatment program with a clinical trial because the treatment best suited to their situation is still being tested. Some clinical trials even exclude patients who have already received another form of treatment.

When participating in a clinical trial that evaluates if a new treatment is better than the current standard treatment for your cancer type, you will always receive treatment – either the standard of care or the new treatment being studied. By being in a clinical trial, you may receive the added benefits of a new treatment before it is available to the public.

In many cases, cancer research moves at a faster pace than the FDA treatment approval process. Researchers have made important discoveries about biomarkers and mutations that affect how cancers respond to treatment. Because of the long time it takes for a treatment to be tested through the clinical trials process, many of these breakthrough treatments are still only available through participating in a clinical trial.
Why Should I Consider A Clinical Trial?

A clinical trial is a medical research study that tests new ways to prevent, screen, diagnose, or treat a disease. The first step is to speak with your oncologist to find out if a clinical trial is right for your cancer journey. The National Comprehensive Cancer Network (NCCN), an alliance of 21 leading cancer centers, believes that “the best management for any patient with cancer is in a clinical trial.”

Why should I consider a clinical trial?
Here are the top reasons why you should consider a clinical trial:

Complete care
The "standard of care" is what the medical community agrees is the treatment for a specific type of cancer given the patient's overall health. Clinical trials ALWAYS provide treatment that is the standard of care or better. For example, in a randomized Phase III trial for a promising new chemotherapy drug, some patients would get the treatment under study while others get the standard of care. Or some patients would get the current standard of care plus the treatment under study while others get just the current standard of care.

Personalized Medicine
Many of the newest clinical trials focus on very specific tumor types such as tumors that carry specific genetic mutations, markers, or DNA sequencing. Basically, these treatments are tailored to individual cancer diagnoses. Many of these treatments are only available through clinical trials.

Careful monitoring
Because the promising new treatment is being carefully studied, patients are also carefully monitored by health care professionals to see how they are doing and to watch for side effects. So, patients enrolled in clinical trials tend to talk with their health care professionals more often and are watched more carefully than patients not involved in a trial.

Safety first
Requirements for clinical trials are strictly managed by the Food and Drug Administration. Before a drug is approved for testing in humans, the FDA ensures that it has gone through strict testing protocols in laboratory animals.

Close to home
Most people are familiar with the tremendous research being conducted all over the country at research institutions, but in fact, many community cancer centers offer opportunities for their patients to participate in clinical trials. Depending on the type of clinical trial you seek, you may have many options that do not require you to travel.

Scientific advancement
Without clinical trials, there is no progress toward cures for cancer. By participating in scientific research through a clinical trial, you can help future cancer patients access new, better
treatments. You can play a more active role in your own health care. People who are treated through clinical trials have access to the best new treatments before the general public.

**Now that I know the benefits of clinical trials, what are the risks?**
There are risks involved with the treatment for any life-threatening illness, including treatment offered through clinical trials:

- There may be difficult side effects from medications or treatments.
- The treatment may not be effective.
- The clinical trial may require extra time for trips to the study site, treatments, hospital stays, or complex dosage requirements.

However, through the process of "informed consent," your medical team will make sure you understand all the risks and benefits.

**How can I find a clinical trial?**
If you are interested in participating in clinical research, your first conversation should be with your doctor. She or he may be able to suggest trials or help you search for appropriate options.

*My PearlPoint’s Clinical Trial Locator* (my.pearlpoint.org/clinical-trials/search) uses clinicaltrials.gov for our search data, as all clinical trials have to be registered with them. Be aware that the information may not be up-to-date. Your best source of information will be with the facility that is conducting the clinical trial. Their contact information will be clearly noted.

**How To Talk to Your Doctor About the Latest Cancer Research**
If you are interested in participating in a clinical trial, the first step is to talk to your healthcare team.

**How To Start the Conversation**
Here are some tips for talking to your doctor about clinical trials:

- Don’t be afraid to ask. Your doctor may not bring up clinical trials, but you are the person being treated so you should be involved in planning your treatment.
- Do not feel that you are second-guessing your doctor. Your doctor should be willing to discuss options with you and answer all your questions without feeling insulted.
- Do not be afraid to seek a second opinion if necessary.
- If possible, talk to your doctor about clinical trials before you begin treatment. Some trials require that participants have not received any other treatments.
- Write down your questions and what you want to talk about before your appointment. Organize your thoughts and your notes so you don’t forget anything.
- You may wish to have your caregiver go with you to your appointments. Your caregiver can take notes or ask any additional questions if you happen to forget.
- Search *My PearlPoint’s Clinical Trial Locator* (my.pearlpoint.org/clinical-trials/search) to find possible trials on your own. If you’ve done some research, beginning the
conversation with your doctor may be easier, especially if your treatment location is not a large research center.
- Keep in mind that while a clinical trial may be one patient’s best option, there may not be a clinical trial option for your diagnosis. You should discuss ALL your treatment options with your healthcare team to create the best treatment plan for you.

**What To Ask Before Starting a Trial**

Once you find a trial and meet the eligibility requirements, you will go through a process called informed consent. During this process, your healthcare team and members of the research team conducting the trial will tell you all you need to know about the trial. Make sure you receive answers to the questions below:

- What is the purpose of the trial?
- How will the trial treatment be better for me than other treatment options?
- How will the healthcare team learn if I am eligible for the trial?
- Where will I receive treatment?
- What type of treatment will the trial involve?
- What will happen at my appointments? (For example, will I have scans, blood tests, and/or examinations?)
- During the treatment, who should I contact with questions and concerns?
- What are the risks and benefits of this trial?
- Will my insurance cover the cost of the trial?
- Will I receive any financial assistance for travel and lodging?
- What will my follow-up care be?
Most cancer patients experience some side effects as a result of their diagnosis or treatment. The type of side effects depends on your diagnosis, treatment type, and overall health. Some of the most common side effects for cancer patients include: fatigue, loss of appetite, nausea, pain, and weight loss. Talk to your healthcare team about your risk for side effects—which side effects are you most likely to experience?

Side effects can be managed a variety of ways with lifestyle changes, nutrition, exercise, and medication. Read through the following sections to learn tips for managing your side effects to help improve your cancer journey.

Changes in Taste and Smell

Changes in taste and smell can interfere with maintaining good nutrition during treatment. Here are some ways to manage changes in taste and smell.

- Note which foods and liquids taste and smell different.
  - Any or all of the four tastes — salty, sweet, bitter, and sour — may be affected.
  - It is common for meats to taste especially bitter.
  - Sometimes one taste is specifically more pronounced. For example, everything may taste really salty, or sweets may taste so sweet they are not appealing.
  - Pay attention to changes in taste to be able to apply these tips appropriately.
- Take care of your mouth and teeth.
  - Dental issues may affect taste, so visit your dentist prior to treatment.
  - Rinse mouth thoroughly before eating using plain water or a baking soda/salt water mixture. Mix ¼ tsp. of baking soda and 1/8 tsp. salt with 1 cup warm water.
  - Sometimes medications, chemotherapy drugs, and radiation cause a film to form inside the mouth, affecting the taste buds. Rinsing may help to clean away this film.
  - After meals, rinse with an alcohol-free mouthwash or the baking soda/salt water mixture.
- If meats taste bitter or are not appealing, try alternative protein sources such as eggs, beans, cheese, or nuts.
  - If beef tastes bitter, try chicken, turkey, or fish.
  - Marinades that are sweet are often able to counter the bitter flavor of some meats.
  - Other sources of protein to try are eggs, cheese, nuts, or beans.
  - It is important to find high protein foods that are palatable to best meet the body’s protein needs.
- Try to keep odors to a minimum.
  - Do not cook anything with a long cooking time in the house where the person who is in treatment spends most of his/her time.
Use cups that have lids and use straws to limit the odor of any liquids that are not appealing.
Serve foods at room temperature. Hot foods tend to have a stronger smell than cold foods.

- Limit exposure to metal.
  - Eat using plastic utensils instead of metal.
  - Prepare and store food in glass pans and containers.
  - Between meals, sour flavors such as lemonade or candy may help. Mint candy or gum may also give some relief.
  - Tart or bitter flavors may be more palatable. Try citrus and vinegar based foods. Seasoning food differently and more heavily may help to mask the metallic flavor.
    - Try barbeque sauce, salad dressings, ketchup, mustard, relish, onion, garlic, rosemary, ginger, chili powder, basil, oregano, tarragon, curry, and cumin.

- Don’t be afraid to try some new foods.
  - Sometimes foods you didn’t like before cancer treatment become more appealing as tastes change.
  - Do not be surprised if favorite foods do not taste the same as they did before.
  - Be patient as these changes are usually temporary.
  - Try to make good nutrition a priority and stock your home with a variety of healthy foods.

“Chemo Brain” (Cognitive Issues)

Many cancer patients report issues during and after cancer treatment including:

- memory loss
- forgetfulness
- loss of concentration
- confusion

These side effects result from changes in the cognitive (thinking) processes of the brain. Even though these side effects are commonly referred to as “chemo brain,” factors other than chemotherapy can lead to cognitive side effects such as:

- brain cancer or brain metastasis
- brain surgery
- radiation to the brain
- medications
- fatigue
- anemia
- hypothyroidism
- stress and anxiety

Cognitive side effects can be short term or long term. This depends on the cause of the side effects, the age of the patients, and the overall health of the patient. If the cause is medication,
once the medication is stopped, cognitive issues should improve. If surgery or radiation damages the brain or nervous system, the side effects may not improve over time. Delirium is a severe cognitive issue indicated by loss of awareness and memory, drastic changes in behavior and judgment, and lack of muscle control. Delirium can be dangerous if the person is left alone. Delirium is most likely to occur in advanced cancer patients or near end of life.

Cognitive issues present many challenges. Because the direct cause of cognitive issues can be unclear, they are difficult to treat. Healthcare professionals are still researching cognitive issues as they relate to cancer and cancer treatment. Changes in memory and brain function can be distressing, but many patients share the same experience. There are some things you can do to manage cognitive side effects.

Plan Ahead

- Write to-do lists.
- Keep a detailed calendar of appointments and other important dates.
- Leave notes around the house to remind yourself to do things.
- Track your medications and use a weekly pill box.
- Lay out everything you need for the day the night before.
- Use your phone to set reminders.

Get Organized

- De-clutter your home and your workspace.
- Make sure everything has a place.
  - Put keys in bowl by the door every day.
  - Leave your cell phone on your nightstand.
- Use labels for storage areas and boxes.

Minimize Distractions

- Avoid multitasking; focus on one task at a time.
- Put your phone and other unnecessary electronic devices away when working.

Exercise Your Brain

- Do “brain exercises” by taking free online quizzes or playing along with game shows.
- Try Sudoku or crossword puzzles.
- Read.
- Learn a new hobby such as painting or writing.

Exercise Your Body
• Exercise is not only good for your body. It can make you feel better mentally, too. Exercising releases mood-boosting endorphins.
• Exercise also combats fatigue, which can contribute to cognitive issues.
• Try going for a daily walk or taking an exercise class.
• Ask your healthcare team before beginning any exercise program.

Eat Well

• Choose foods that promote healthy brain functioning such as fish (omega-3 fatty acids), dark leafy greens, fresh fruits and vegetables, and whole grains.
• Avoid alcohol and other substances that alter cognition.

Get Plenty of Rest

• Being tired can make you less focused.
• Fatigue and insomnia are common side effects of cancer treatment.

Check Red Blood Cell Counts

• Anemia is a condition that occurs when the body does not have an adequate amount of red blood cells.
• Anemia can cause cognitive issues.
• Ask your healthcare team to check your red blood cell counts if they are not doing so already.

De-Stress

• Anxiety and stress can cause or worsen cognitive issues.
• Try to relax in a way that works for you. Consider trying:
  o Deep breathing
  o Meditation
  o Taking a warm bath
• Your doctor may be able to prescribe medication to help with anxiety and depression.
• Try seeking emotional support from a support group or one-on-one partnering organizations.

Ask for Help

• Be honest with your friends and family about your “chemo brain.”
• If you explain what you are going through, they can be more understanding.
  o They can also help you manage your side effects by sending you friendly reminders or helping you organize your space.
• As always, talk to your healthcare team about your side effects and ways to manage them.
Constipation

Constipation is common during cancer treatment. It can be caused by many factors such as cancer type, food and liquid intake, surgery, or medications. Follow these tips to manage constipation and promote regularity.

- Soluble and insoluble fibers are both important for overall health and nutrition.
  - Soluble fiber is found in oats, beans, sweet potatoes, and fruits.
  - Soluble fiber is completely digested by the body. Soluble fiber reduces cholesterol, stabilizes blood sugar, and rids the body of toxins.
  - Insoluble fiber is found in wheat, nuts, seeds, and fruit and vegetable skins.
  - Insoluble fiber is not digested by the body and is excreted as waste. Insoluble fiber promotes regularity.
- Drink plenty of liquids.
  - Fluid helps your body process fiber without discomfort. A good starting goal is eight 8-ounce glasses of fluid per day.
- Gradually increase your fiber intake.
  - Your daily goal should be between 25-35 grams daily.
  - Fiber is mostly found in plant foods, such as fruits and vegetables, beans, legumes, whole grain cereals, breads, and oatmeal.
- Eat 3-5 servings of fruits and vegetables daily.
  - Choose whole fruit instead of juice.
  - Eat the skins and seeds for extra fiber.
  - Try to have a fruit or vegetable with each meal or snack.
- Choose foods that promote regularity.
  - Eat cereals, breads, and pastas that are made with 100% whole grain.
  - Have brown or wild rice in place of white rice or potatoes.
  - Choose hot cereals like oatmeal or cold cereals with at least 5 grams of fiber.
  - Choose whole wheat breads, whole corn or wheat tortillas, and whole grain crackers instead of refined products.
  - Eat more beans, lentils, and peas. Add them to soups and casseroles, or have as a main entrée.
  - Beans are also a great source of protein, so you can use them as a substitute for meat at mealtimes.
  - Beans can be gas forming, so add them gradually. If you experience bloating or discomfort, you may want to limit them in your diet.
- Try plum or prune juice.
  - Start with a small amount such as a ½ cup.
  - Eating dried prunes may also help relieve constipation.
- Try to include exercise or physical activity in your daily routine.
Physical activity is a natural way to help constipation.  
Always discuss any exercise or physical activity with your healthcare team before making changes.

- Talk to your healthcare team about medication or supplements to help with constipation.
  - There are over the counter medications that may help with constipation but you should always check with your doctor first before taking anything.

**Diarrhea**

Diarrhea occurs when foods pass through the body too quickly. The body cannot absorb enough nutrients, vitamins, minerals, and water. Follow these tips to carefully manage diarrhea and prevent dehydration and malnutrition.

- Contact your healthcare team for advice managing diarrhea.
  - If you have sudden diarrhea, have diarrhea for more than 24 hours or are experiencing pain, cramping, or blood in your stools, call your healthcare provider immediately.
  - Take medications or supplements only if they are recommended by your healthcare team.
  - Always ask your healthcare team first before taking anti-diarrhea medications.
  - Always talk to your healthcare team or a dietitian before taking any supplements.

- Stay hydrated to replace fluid losses.
  - Be sure to drink plenty of clear liquids (water, ginger ale, sports drinks, or electrolyte replacement drinks) for 12 to 24 hours after a sudden bout of diarrhea.
  - Make a homemade electrolyte replacement drink by mixing the following ingredients: 
    - ¼ teaspoons salt, 8 teaspoons sugar, 3 tablespoons orange juice concentrate, and 4 cups water.
  - Let carbonated drinks lose their fizz before you drink them.
  - Drinking clear liquids helps the bowel rest and replaces lost fluids.
  - Healthy people need a minimum of 8 cups of liquid per day. You may require more to replace fluids lost with diarrhea.

- Eat 5 or 6 small meals per day instead of 3 larger meals.
  - Eating smaller meals may put less stress on your bowels and will make it easier for your body to digest food.

- Choose foods and drinks carefully.
  - Very cold foods and very hot foods can make diarrhea worse.
  - If your diarrhea gets worse after eating a certain food, stop eating that food until you recover.
  - Avoid foods and drinks that can make your diarrhea worse. High fiber foods, raw fruits and vegetables, full-fat dairy products, foods and drinks that contain caffeine, and spicy or high-fat foods can make diarrhea worse.
  - Choose foods that help manage diarrhea, like white rice, puffed rice cereal or other low-fiber grains, soft fruits like bananas and applesauce, cooked soft vegetables, and low-fat meats and dairy products.
Difficulty Swallowing

Treatment to the head and neck can make swallowing difficult and painful. This may make it hard to eat well and maintain a healthy weight. Follow these tips to make swallowing easier.

- Chemotherapy or radiation to the head and neck can harm the cells that line the throat and cause discomfort.
  - Higher doses of radiation can cause more discomfort.
  - Chemotherapy and radiation treatment at the same time may make side effects worse.
  - Drinking alcohol or using tobacco can make side effects worse.
- Use mealtime tactics to make swallowing easier.
  - Eat 5 or 6 small meals each day instead of 3 large meals. It may be easier to eat a smaller amount of food at one time.
  - Cook foods until they are soft and tender.
  - Moisten and soften foods with gravy, sauces, broth, or yogurt.
  - Consume liquids with meals.
  - Sip drinks through a straw; this may make them easier to swallow.
- Avoid foods that are hard to swallow or irritating.
  - Avoid coarse foods that do not soften in the mouth.
  - Avoid sharp and crunchy foods like potato and tortilla chips.
  - Avoid spicy foods.
  - Avoid acidic foods like lemons, lime, oranges, and tomatoes.
  - Be careful eating hot foods to reduce the risk of burning your mouth. Cold foods may be soothing.
  - Avoid alcohol.
- Choose foods that are easy to swallow.
  - Try breakfast foods like instant oatmeal, grits, pancakes, waffles, and cold cereal that has been softened in milk.
  - For a main dish, try chicken, tuna or egg salad, soups and stews, soft cooked fish, tofu, and meatloaf.
  - Pick side dishes like cottage or ricotta cheese, macaroni and cheese, mashed white or sweet potatoes, and rice or risotto.
  - Try desserts like custard, tapioca pudding, ice cream, milkshakes, and sherbet.
  - Choose snacks like creamy nut butters, applesauce, gelatin, smoothies, and yogurt.
Dry, Itchy Skin

When cancer treatments fight cancer cells, they can also affect healthy cells. This can result in certain side effects including skin changes. Side effects of the skin commonly occur with two cancer treatments: external beam radiation therapy and new targeted therapies.

External Beam Radiation Therapy
With external beam radiation therapy, high-energy radiation rays from outside the body are used to kill and shrink cancerous tumors. The radiation is targeted at a specific area of the body. This therapy usually consists of daily treatments over several weeks. Skin side effects, such as the following, do not usually appear until about the third week of treatment and may continue after finishing treatment:

- The skin at the treatment area may become red, dry, and tender like a mild to moderate sunburn.
- The skin may also become very itchy, which is a condition called pruritus.
- In some cases, the skin may even darken, swell, blister, or peel away.
- If the skin becomes moist or cracked, you are at risk for an infection.

If side effects become too severe, your radiation oncologist may stop or delay treatment to allow your skin to rest.

Targeted Therapies
Targeted therapies focus on or “target” a specific type of cell or molecule. Common types of targeted therapy drugs attack the epidermal growth factor receptor (EGFR) to stop cancer cells from continuing to grow. Because EGFRs are also important to normal skin cell growth, this may cause skin side effects. The most common skin side effects with targeted therapies are rashes, dry and itchy skin, hair loss, redness, and inflammation around fingernails and toenails. These side effects most commonly appear after the second or third treatment.

The following are targeted therapies (drugs) that commonly cause skin changes:

<table>
<thead>
<tr>
<th>Drug</th>
<th>Type of Cancer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Erlotinib, Gefitinib, Cetuximab, Panitumumab</td>
<td>Colorectal, Head and Neck, Lung, Pancreatic</td>

How can I manage my skin side effects?
First, always tell your healthcare team about any skin changes you notice. Some side effects can be easily managed with prescription creams or oral medications. Here are some tips to help take care of your skin while undergoing cancer treatment:
Avoid irritants.

- Use unscented bath and household products including soap, shampoo, lotion, detergent, and dryer sheets.
- Do not use bath products containing alcohol. Alcohol dries the skin, making irritation worse.
- If your facial skin is affected, avoid using makeup, or switch to a sensitive skin brand.
- Always wear gloves when cleaning, and avoid skin contact with cleaning products.
- Do not shower or bathe with extremely hot or extremely cold water.
- Stay out of the sun, or wear protective clothing and sunscreen if you must be outside.
- Do not use tanning beds.
- Do not use chlorinated pools or hot tubs.

Let your skin rest.

- Do not scratch or pick at your skin.
- Do not pop blisters.
- Wash skin with care.
- Use a mild, fragrance-free soap.
  - Do not scrub the skin.
  - Let warm (not hot) water gently run over the affected area.
- Do not wear tight clothing over the affected areas.
- Do not use adhesive bandages.

Moisturize.

- Keep skin well moisturized.
- Use petroleum-based skin protectants or unscented lotions.
- Look for moisturizers specifically for sensitive skin.
- Ask your doctor which over-the-counter moisturizer is best for you.
- Use a humidifier while you sleep, and keep the temperature cool.
- If you are having radiation treatment, do not apply moisturizers right before treatment. It’s better for your skin to be clean and clear during actual treatments.

Watch for signs of infection.

- Signs of infection include:
  - Swelling, redness, or warmth
  - Cloudy drainage or pus instead of clear
  - Fever
  - Bad smells
- Tell your doctor immediately if you notice signs of infection. You may need an antibiotic. If left untreated, infections can become very serious and spread to other parts of the body.
Dry Mouth

Dry mouth is common during and following cancer treatment. Symptoms of dry mouth are thirst, sore mouth or throat, difficulty swallowing, and changes in taste. Follow these tips to manage dry mouth.

- Chew gum or suck on ice chips, hard candy, or popsicles to help relieve dry mouth.
  - Keeping gum, ice chips, candy, or popsicles in the mouth helps keep the mouth moist.
  - Choose sugar-free or low-sugar gum or candy for prevention of cavities.
  - In place of ice chips, try frozen grapes.
  - Use lip balm if your lips become dry.
- Choose foods that are easier to chew and swallow.
  - Choose soft foods like scrambled eggs, puddings, and ice cream.
  - Avoid dry foods.
  - Cut your food into small pieces to make it easier to chew and swallow.
  - Soups and stews are good options, as long as meats are soft or cut into small pieces.
  - Try mashed potatoes and rice instead of crackers or breads.
  - Choose canned fruits or applesauce instead of raw fruits.
  - Puddings, ice cream, and sorbet are also good options.
  - Serve foods with gravy, broths, or sauces. This will make them easier to chew and swallow.
  - Season your food with citrus and herbs instead of salt or hot spices.
- Drink at least eight to ten 8-ounce cups of liquid each day.
  - Drinking liquids with meals can make it easier to swallow foods.
  - Sip cool drinks in between meals to ensure adequate fluid intake.
  - Tart drinks in small amounts, such as lemonade, may help your mouth produce more saliva.
  - Keep a glass of water next to your bed at night. Drink when you wake during the night.
- Eat small meals, and eat more often.
  - Eating small, frequent meals will ensure that you are meeting your nutritional needs.
  - Try to have a good source of protein with meals and snacks. Eggs, cottage cheese, yogurt, beans, lentils, and smoothies are good soft food choices that also provide protein.
- Promote a moist mouth.
  - Rinse your mouth every 1-2 hours.
  - Mix ¼ tsp. of baking soda and 1/8 tsp. salt with 1 cup warm water. Rinse with plain water after using this mixture.
Do not use a mouthwash that has alcohol. Alcohol makes a dry mouth worse.

Ask your doctor if an artificial saliva product might help. Radiation and some medications can decrease saliva production.

Avoid things that make dry mouth worse.

- Alcoholic drinks can worsen dry mouth.
- Do not smoke or use other tobacco products.
- If you do smoke, talk to your healthcare team about quitting.

Tell a doctor or nurse if you have white patches in your mouth.

- White patches can be evidence of an infection.

**Fatigue**

Fatigue impacts quality of life and can make it hard to eat healthy meals. The body needs proper nutrition to function. Improper nutrition can make other side effects worse. These tips can help manage fatigue.

- Cancer-related fatigue primarily occurs because the body requires additional energy to heal.
  - Other side effects, medications, and stress can make fatigue worse.
- While rest is important, too much rest can make you feel more tired so stay as active as possible.
  - Try going for a daily walk.
  - Talk to your healthcare team before beginning any exercise program.
- Go no longer than 4-5 hours without eating throughout the day.
  - Try to eat a balanced breakfast every day.
  - Try to eat small meals and snacks rather than large meals.
- Eat foods that provide sustainable energy; avoid foods that do not.
  - Try to include a source of protein at every meal to sustain energy released from food.
  - Try to limit sweets and sugary foods.
  - Avoid alcohol, caffeine, and chocolate in the evening.
- Stay hydrated by drinking liquids throughout the day.
- Stock your kitchen with easy-to-prepare foods and meals.
  - Ask your family and friends to help you shop for food and prepare meals.
  - Prepare food when you feel your best, and save it for later.
  - Prepare large amounts of your favorite meals then freeze meal-sized portions for later.
- Try keeping a food and fatigue journal to find patterns that trigger fatigue.
- Discuss fatigue with your healthcare team.
  - Ask your doctor to check for nutrient deficiencies, such as protein, iron, B vitamins, and vitamin D.
Talk to your healthcare team about other side effects such as anemia, pain, or vomiting.

**Feeling Full Quickly**

Feeling full too quickly is a common side effect, especially after abdominal surgery. This can cause weight loss. Not eating enough weakens the body and delays healing. Below are some tips to ensure proper nutrition.

- **Eat small, frequent meals throughout the day.**
  - Smaller meals are easier to digest and will allow you to better meet your needs throughout the day.
  - Keep healthy snacks on hand to eat between scheduled meals.
- **Avoid foods and actions that may cause gas or bloating.**
  - High-fat foods take longer to digest. They can make you feel fuller between meals. Avoid fried or greasy foods.
  - Gas-forming foods include: broccoli, cauliflower, Brussels sprouts, cabbage, corn, turnips, onions, peas, garlic, cantaloupe, watermelon, apples, avocado, beans, lentils, and nuts.
  - Stop behaviors that involve swallowing extra air. Do not suck on ice or candy, chew gum, drink carbonated drinks, or drink through a straw.
- **Drink liquids between meals rather than during meals.**
  - Drinking with your meals and snacks can fill you up more quickly.
  - Avoid carbonated drinks. Carbonated drinks can make you feel fuller.
- **Keep your head up after meals.**
  - Lying down after meals will only make your discomfort worse.
- **If you are underweight or losing weight too quickly, choose foods that are rich in nutrients and calories.**
  - Try to have a source of protein with each meal and snack. Some examples of protein-rich foods include eggs, chicken, fish, meat, milk, yogurt, cheese, beans, nuts, and peanut butter.
  - Add extra calories, protein, and healthy fats to foods you already eat to help prevent weight loss. Try adding olive oil, nuts, nut butters, seeds, non-fat powdered milk, or protein powder to recipes.
  - Drinking nutrient-rich liquids like smoothies or milkshakes can provide nutrition without making you feel full. Liquids leave the stomach more quickly than solid foods.
  - Ask a registered dietitian if drinking a liquid nutrition supplement is needed to provide necessary calories and protein. If needed, a specific liquid nutrition supplement can be recommended that meets your needs.
Gas and Bloating

Excess gas is a common side effect, especially for colorectal and stomach cancer patients. Foods, drinks, behaviors, and medications contribute to gas. These tips may help with the pain, bloating, and discomfort that come with excess gas.

- Avoid gas-forming foods.
  - Avoid broccoli, cauliflower, Brussels sprouts, cabbage, corn, turnips, onions, peas, peppers, radishes, garlic, cantaloupe, watermelon, apples, avocados, beans, lentils, and nuts.
  - Avoid dairy products such as milk cheese or yogurt.
  - Avoid carbonated beverages.
- Avoid behaviors that cause you to swallow extra air.
  - Eat slowly.
  - Do not suck on ice or candy.
  - Do not chew gum.
  - Do not drink through a straw.
  - Drink liquids slowly with small sips.

Insomnia and Difficulty Sleeping

Many cancer patients report that they occasionally have trouble sleeping or that they can’t sleep at all (insomnia). Lack of sleep can lead to other issues such as fatigue, loss of concentration, headaches, and irritability.

To minimize the impact of insomnia, focus on these three possible solutions: managing other side effects of cancer or treatment, creating a good sleep routine, and talking to your healthcare team.

Manage other side effects.
Some side effects of cancer treatment can lead to difficulty sleeping. If you can minimize those side effects, then your sleep may improve.

Nausea
Nausea may make it difficult for you to go to sleep, and vomiting may wake you up at night.

- Sleeping with your head slightly elevated may help you get more comfortable.
- If your doctor has prescribed medication for nausea, make sure you take it as recommended, especially before bedtime.

Pain
Any type of pain can keep you up at night and make it difficult to be comfortable.

- Make sure you take pain medication as recommended, especially before bedtime.
For more information on managing pain, read the pain management section of this handbook.

Weight Gain
If you gained weight as a result of cancer treatment, you may have trouble falling asleep and staying asleep. The extra weight can make it difficult to get comfortable. It can also make sleeping more difficult because your body has to work a little harder to function normally, such as regulating breathing.

- Try using a body pillow to give you more sleeping positions.
- Read the weight gain section of this handbook for more information on how to maintain a healthy weight.

Hormonal Changes
Hormonal changes, such as menopause for women, can disrupt sleep, especially with side effects such as hot flashes and night sweats. Talk to your healthcare team about the best ways to manage hormonal changes. Your doctor may be able to prescribe medications to help manage hormonal changes.

- Cool temperatures can help promote sleep. Make sure your bedroom thermostat is set low and that your pillowcase feels cool to your skin.
- If night sweats are a problem, buy wicking sleepwear to keep you dry at night.

Stress and Anxiety
Stress and anxiety can keep you up at night. It may feel difficult to “turn off your brain.” Finding ways to cope with your stress and anxiety is very important.

- Enjoy a relaxing activity every night before bed to take your mind off cancer. Try working on a crossword puzzle, reading a book, or listening to music.
- Try simple stretches, yoga, or meditation to clear your mind.

At any point in your cancer journey, you may wish to seek emotional support. Support groups, peer matching programs, or individual counseling may help relieve stress and anxiety.

Create a good sleep routine.
Try to create a comfortable and relaxing sleep routine. For example, every night before bed take a hot bath or read a few chapters of a good book. If you do this every night, it will signal to your body that it is time for sleep. The most important thing is that this routine works for you. Here are some tips to get you started:

Tips for creating relaxing sleep environment:

- Make sure your mattress, bedding, and pillows are comfortable for you.
- Pleasant smells, like lavender, may help you sleep. Try an aromatherapy mist on your pillow.
• Buy a fan or white noise machine to drown out other distracting noises.
• Turn out all the lights, and use blinds or curtains to cover the windows.
• Do not leave the TV or computer on while you are trying to fall asleep.
• Silence all call, email, and text alerts on your phone.

**Tips for sleeping through the night:**

• Try to go bed and wake up at the same time each day.
• Choose a small snack, not a large meal, before bed.
  o Digestion may wake you up, but a small snack will keep you from getting hungry during the night.
• Use the restroom right before going to bed.
• Exercise during the day, but do not exercise right before bed.
• The buildup of adrenaline and endorphins from exercise makes it difficult to wind down.
• Limit daytime naps to no more than 30 minutes.
• Avoid caffeine, alcohol, and tobacco products.

**Talk to your healthcare team.**

Always talk to your healthcare team if you are having insomnia or difficulty sleeping. Your doctor may recommend prescription medications or over-the-counter sleep aids to help you fall asleep and stay asleep. Do not take any medications without consulting your healthcare team first. Some sleep aids can be habit-forming so only take these medications as directed by your doctor.

**Lactose Intolerance**

Lactose intolerance occurs when the body cannot digest milk sugar (lactose). Some patients experience lactose intolerance, with symptoms like diarrhea, gas, and stomach cramps after having dairy. These tips may help to relieve symptoms.

• Avoid dairy products and foods containing lactose and instead choose lactose-free or reduced lactose milk products.
  o Most grocery stores sell lactose-free milk and ice cream.
  o After checking with your doctor, consider trying products made with soy or rice instead. Soy milk, rice milk, and almond milk are available at most grocery stores.
  o Yogurt with live active cultures and hard cheeses such as parmesan and aged cheddar are lower in lactose. You may find these to be better tolerated and less likely to cause symptoms
  o Avoid using butter, margarine, cream, or soft cheeses when cooking or preparing foods.
• Read labels carefully.
Avoid foods that have been prepared with milk, butter, milk solids, cream, casein, or whey.
Avoid products with ingredient lists that say “May contain milk”.

- Talk to your doctor about using over-the-counter enzymes.
  - Lactase enzyme products are available in capsule, liquid, or pill form.
  - Taking these enzymes with your meal may help you to digest the lactose in milk and prevent symptoms.

- Choose other calcium-fortified or high-calcium foods.
  - Read labels to find foods that have been fortified with calcium to ensure you are meeting your calcium needs.
  - There are many ways to meet your calcium needs from foods other than dairy products. Other good sources of calcium include leafy green vegetables, broccoli, fortified orange juice, fortified cereals, canned salmon, tofu, almonds soy beans, and white beans.
  - Talk with your physician or a registered dietitian about whether you could benefit from taking a calcium supplement.

- Symptoms of lactose intolerance may improve overtime after treatment ends, but sometimes it can be a long-term problem.

**Loss of Appetite**

Loss of appetite interferes with good nutrition before, during, and after treatment and can contribute to dangerous weight loss. The following are some tips to optimize nutrition while dealing with appetite loss.

- Manage any other nutrition related side effects that may contribute to appetite loss.
  - Nausea, vomiting, diarrhea, constipation, dry mouth, sore mouth, swallowing difficulty, and heartburn may lead to loss of appetite.
  - Talk to a registered dietitian and your healthcare team for assistance with any of these side effects. It is important to get help managing any of these side effects to increase appetite.

- Take note of when your appetite is best.
  - For some people this is in the morning and appetite diminishes throughout the day. For other people it may be the opposite.
  - When you feel well, eat as much nutritious food as possible in case you do not feel well later.
  - Do not limit or restrict food intake when appetite is good.

- Eat 5-6 small meals per day and snack anytime.
  - Small amounts of food are typically easier to digest and are easier on the stomach. It is often easier to better meet nutrition needs while battling appetite loss with smaller amounts of food more frequently.
• Keep healthy snacks around, and do not go more than three hours without eating.
  o Pack a cooler or insulated lunch bag to take on longer trips or to appointments
    when the wait time is variable.
  o Keep small containers of fruit, dried fruit, trail mix, small bottles of juice, yogurt,
    cheese, whole grain crackers, cereal, granola bars, and other portable food items
    that are easy to eat and require little to no preparation.
  o Always keep snacks visible and available as a reminder that it is important to eat
    to get the body the nutrients it needs.
• If food is not appealing, have a nutritious beverage instead.
  o A high-protein shake or smoothie can have as many calories as a small meal or
    large snack.
  o Have a ready-to-drink liquid nutrition supplement when food is not appealing.
  o Milkshakes, smoothies, or protein shakes can be made with yogurt, milk, ice
    cream, protein powder, fruit, and other ingredients using a blender. Have these
    ingredients available for times when a drink sounds better than a meal.
• Drink liquids between meals.
  o Sometimes drinking liquids with meals causes the stomach to get full faster. This
    prevents eating enough and maximizing nutrition from food sources.
  o If an early feeling of fullness is a problem, try waiting to drink any liquids until
    after a meal and do not drink any liquids for at least 30 minutes before a meal.
• Add calories and protein to foods to give their nutrient content a boost.
  o There are ways to add protein and calories to foods that are already eaten
    regularly.
  o Add a scoop of protein powder to a shake or smoothie.
  o Add healthy fat such as olive oil, nuts, or nut butter to recipes and other dishes to
    boost the calorie content.
  o Ask a registered dietitian for other suggestions on how to increase the protein
    and calorie content of foods.
• Exercise or do some physical activity at least an hour before a meal.
  o Regular exercise may help increase appetite.
  o Go for a 20-minute walk before sitting down to a meal.
• Get in the habit of having a bedtime snack.
  o An easy-to-digest snack such as yogurt and fruit, cheese and crackers, or peanut
    butter and crackers is an easy way to get some additional nutrition and will not
    impact appetite for the next meal.
  o If reflux or heartburn is an issue, have this snack at least one hour before lying
    down.
• Emotions are often related to appetite. Talk to your healthcare team about managing
  your emotional well-being.
  o Depression, anxiety, fear, and stress can all affect appetite.
o Trained health professionals such as social workers and psychologists can assist in managing these emotions.

o Support groups are another resource that may help in processing these emotions.

**Nausea**

Nausea and vomiting are common side effects of cancer treatment that can cause dehydration, poor nutrition, and weight loss. Follow these tips to control nausea and vomiting.

- **Take anti-nausea medications as prescribed by your healthcare provider.**
  - It is important to take anti-nausea medications as prescribed.
  - Do not wait until the onset of nausea to take medication.
  - It is best to attempt to keep nausea managed with medication to allow for consistent eating and optimal nutrition.
  - Call your healthcare provider if you are taking the medication as prescribed and it is not providing any relief. A different medication may be needed.

- **Track nausea to determine causes and trends.**
  - Some nausea may be directly related to chemotherapy.
  - It is beneficial to know how soon after chemotherapy the nausea begins. Sometimes it is immediate and other times the onset is delayed.
  - Tracking may help to identify other triggers or causes of nausea.

- **Keep odors to a minimum.**
  - Odors can lead to nausea so it is best to choose foods with little or no odor such as oatmeal, cereals, canned fruit, shakes, and smoothies.
  - When preparing food at home, opt for foods with short cooking times and minimal odor such as pancakes, scrambled eggs, reheated soup, or other prepared foods that just require reheating.
  - Cool and room temperature foods usually have fewer odors than hot food.
  - Avoid cooking foods that have long cooking times such as casseroles, meats, and slow cooked meals.
  - Ask friends or family members to cook these items in an alternative location like a neighbor’s kitchen.

- **Eat several small meals or snacks during the day.**
  - Eating small meals or snacks 5-6 times per day instead of 2 or 3 larger meals may help with nausea management. This keeps the stomach from getting too empty and prevents excess stomach acid.
  - Chew all foods very well. The digestion process begins in the mouth.
  - Keep bland, odorless snacks on hand for easy meals and snacking. Some examples are crackers, cheese, canned fruit, yogurt, toast, rice, and pasta.
Not all foods are appealing to everyone. The key is to find the foods that are tolerable and stock up on those.

- Create a relaxing environment for eating and snacking.
  - Lighting, temperature, and other external cues may make nausea worse.
  - Dim lighting and cooler temperatures tend to be better for nausea management.
  - The use of a fan or ceiling fan may also make a difference.
  - It is important to be removed from situations that contribute to anxiety when attempting to enjoy a meal or a snack. (i.e. loud voices, arguing, loud music, or non-relaxing television programs).
  - Soft relaxing music, a relaxing television program or another activity that is relaxing in a cool, dim room may be the best environment for meals and snacks.
  - Rest after meals but do not lie flat as this may trigger nausea.

- Experiment with different foods.
  - Everyone is an individual and not all foods work for everyone when nausea is an issue. Try to be patient and experiment with different foods.
  - Start with bland foods with minimal odor and introduce them one at a time.

- Avoid foods and behaviors that tend to trigger nausea.
  - Some foods are triggers for nausea for unexplained reasons. Some of these reasons may be psychological. It is best to avoid these foods for optimal nutrition. The time that it takes to recover from an episode is time that the body is missing out on good nutrition.
  - Foods that are harder to digest and stay in the stomach longer can be triggers for nausea. These foods are usually higher fat foods such as fried foods and foods prepared with a lot of butter or oil.
  - Spicy foods are usually not tolerated well.
  - Some behaviors such as eating in a restaurant may trigger nausea. If this is the case, order food to carry out and eat it in a more relaxing environment.
  - Caffeine and smoking contribute to nausea.
  - Limit or avoid smoking, and drink only decaffeinated beverages.

- Try foods and drinks containing ginger.
  - Ginger is a spice that has shown some promise for relief from nausea.
  - Ginger snaps, ginger ale, ginger gum, or ginger tea may be options that can help manage nausea.
  - Ginger is also common in some Asian recipes.
  - Ginger supplements are available; however, they have not been studied extensively to determine an effective dose.

- Avoid drinking while eating.
  - Sometimes excess liquid in the stomach contributes to nausea.
  - It is best to drink any beverages at times other than meal times.
- The best beverages to choose are water, 100% fruit juices without added sugar, and caffeine-free soda that no longer has carbonation.
- Ginger ale specifically may help with nausea.
- Wear loose-fitting, comfortable clothing.
  - Clothing that is tight especially around the midsection can trigger nausea.
  - Soft, comfortable fabrics tend to be more relaxing as well.
- Stay hydrated if vomiting occurs.
  - Continue to drink clear liquids including water and other electrolyte containing beverages like sports drinks.
  - Attempt to eat bland foods such as crackers or toast.
  - If vomiting is continuous and cannot be controlled, contact your healthcare provider immediately.

Pain

Cancer and Pain
Pain related to cancer comes in many different forms. Pain can be caused by the cancer itself, or it can be a side effect of treatment.

For the best pain management, you and your healthcare team will first need to find out the cause of your pain. Be prepared to answer these questions:

- How severe is your pain?
- Is there anything that makes it better?
- Is there anything that makes it worse?
- What does it feel like—an ache or a sharp pain, dull, throbbing, or tingling?
- Is the pain in only one part of your body?
- How does the pain interfere with your daily life?

Keeping a pain journal can be helpful. Use the Treatment and Side Effects Log included in this handbook.

Is the pain a side effect of treatment?
Chemotherapy, radiation, and surgery are the three most common cancer treatments, and pain is a potential side effect for all three. However, the type of pain caused by each is different.

Chemotherapy can cause the following types of pain: muscle and joint aches, mouth sores, headaches, and neuropathy. Neuropathy is an unpleasant tingling or numbness, usually in the hands or feet. Damage to nerve endings causes this feeling.

Radiation causes the skin at the treatment site to become dry, red, and painful like a mild to moderate sunburn. Sometimes these burns blister. Depending on the location of radiation, there may be other side effects. For example, radiation to the brain may cause headaches.
Surgery causes pain at the incision site. Depending on the extent and location of the surgery, this pain could be mild to severe. Surgery can damage muscles and tissues leading to range of motion problems. Surgery can also damage nerves and cause neuropathy.

Is the pain a side effect of the cancer itself?

Depending on size and location of the tumor, pain could be from the cancer itself. If the tumor is pressing on nerves, joints, or bones, it can cause pain. This type of pain is more common with advanced or metastatic cancer, especially when the cancer spreads to the bones. Tumors in the bones can cause fractures as the tumors continue to grow.

Pain Management Plans

Your healthcare team can help create the best pain management plan for you. If the first plan you try does not work, tell your healthcare team. You may need to try a different plan. Open and honest communication with your healthcare team is very important. Pain is a difficult side effect to treat. It may take a few tries to find the best plan for you. Do not be afraid to seek a second opinion if needed.

Your pain management plan may include:

Pain Medications

Your doctor may prescribe pain medications or suggest over-the-counter pain medications. Ask your doctor before taking any over-the-counter medications. Some pain medications can cause nausea or constipation. Your doctor may be able to suggest additional medications to help with these side effects. You may have to try a few different types of medications or dosages to find what works for you.

Physical Therapy

Physical therapy uses exercises to help improve strength and motion. If your pain is related to loss of range of motion or difficulty doing physical activities such as walking, physical therapy may help ease pain.

Exercise

Regular exercise, even something as simple as a daily walk, may also help with pain. Exercising is good for the body. It can also make you feel better mentally too. Exercising releases endorphins, natural chemicals that make you feel happier. Exercising also combats fatigue which is a common side effect along with pain. Always ask your doctor before beginning an exercise plan.

Complementary and Alternative Medicine

Some cancer patients find success at relieving pain with complementary and alternative medicine (CAM) such as acupuncture, guided imagery, massage, supplements and vitamins, or yoga. The phrase “complementary and alternative medicine” means treatments outside the standard scope of what you would find at a hospital or treatment center. Complementary medicine is used along with standard treatment. Alternative medicine is used instead of standard treatment.

Always discuss the pros and cons of each treatment you consider with your healthcare team. If you are considering a complementary treatment, inform your medical team BEFORE you are
treated to make sure it will not negatively interact with your standard treatment. If you are considering quitting standard treatment for an alternative treatment, remember: standard treatments go through a long and careful research process to ensure that they are safe and effective, but less is known about most types of CAM.

For more information on CAM, visit the National Center for Complementary and Alternative Medicine website.

**Palliative Care**

Palliative care provides relief from pain and other symptoms, but it does not provide a cure. For cancer patients, common palliative therapies include surgery, radiation, or chemotherapy as a method of shrinking tumors that are causing pain. Palliative care is most commonly used for advanced or metastatic cancers.

**Emotional Support**

Taking care of your emotional well-being can also help manage pain. There are a number of ways to find emotional support—peer partnering programs, support groups, and one-on-one counseling.

Your doctor may even prescribe antidepressants, which have been shown to help with nerve pain as well as emotional well-being.

**Managing Other Side Effects**

Other side effects of treatment, such as fatigue, nausea, or loss of appetite, may be making your pain worse. You may be able to manage many of these side effects with simple nutrition and habit changes.

**Reflux, Heartburn, and GERD**

Heartburn, reflux, and GERD (gastroesophageal reflux disease) may occur during cancer treatment. Cancer treatments or medications may affect parts of your digestive tract and cause the food and liquids in your stomach to reflux (travel back) into your esophagus (food pipe). Patients with reflux may have symptoms such as swallowing difficulty, a sore throat, sour taste in your mouth, heartburn and painful digestion.

Talk with your healthcare team for the best care for reflux. Here are some tips and guidelines to help control reflux:

**Go small.**

- Eat 5-6 small meals or snacks throughout the day. Smaller amounts of food are easier for the body to digest and absorb.
- Smaller amounts of food also mean there is less food that can travel back up the food pipe.
Choose lean.
- Avoid fried and fatty foods. These foods are hard to digest and stay in your stomach for a long time. Time increases risk for reflux.
- Choose baked, broiled, or grilled foods instead.

Dress for comfort.
- Wear loose-fitting clothes, especially clothes that are not tight around your stomach.
- Clothes that are tight around the stomach can trigger reflux.

Avoid smoking and alcohol.
- Smoking cigarettes (including e-cigarettes) and drinking alcohol can trigger reflux.
- Instead of after-dinner drinks and cigarettes, chew sugarless non-mint gum for 30 minutes after meals. This encourages food to move through your digestive system.

Sit up.
- Pay attention to your posture.
- Sit up at least 1 hour after eating.
- Good posture helps your breathing and may reduce fatigue during eating.
- Raise the head of your bed 6 to 9 inches by putting wooden blocks under the legs of the head of your bed.

Slow down.
- Eat slowly and chew food really well. Digestion begins in the mouth.
- Smaller food pieces are much easier to digest and are less likely to cause discomfort.
- Meals eaten in calm, relaxed place seems to be better digested.
- Added stress from treatment can also trigger reflux; try to eat when you are feeling most relaxed.

Choose well.
- Some specific foods and drinks may cause reflux symptoms.
- Some common problem foods and drinks may be: chocolate, cocoa, mint, whole milk, caffeine, pepper, some fruits/juices, pastries and other high-fat desserts.

Write it down.
- Record in a log the times you eat, the foods and drinks you consume, and any reflux symptoms.
• If you eat a large portion of a problem food, you may have symptoms. Try a small portion and take notes in your log. Use your log to eliminate items that cause reflux symptoms.
• Avoid “problem foods” for a couple of days to see if symptoms disappear.

Avoid eating before bed.

• Avoid eating too close to bedtime.
• Have your last food or drink 1-3 hours before you recline.
• If still having trouble sleeping due to reflux, you may need to raise the head of the bed so that gravity helps keep food down in the stomach.

Ask for help.

• Consult a local registered dietitian for specific recommendations based on your level of food tolerance.
• Talk to your healthcare team if symptoms persist or get worse.

Sexual Side Effects

Female Sexual Side Effects

Many female cancer patients experience sexual dysfunction or changes in their sex lives after a cancer diagnosis. These changes can be physical or mental. Many women are not comfortable discussing these issues with their healthcare team or with their partners, but being able to speak openly is important.

Each type of cancer treatment—chemotherapy, radiation, surgery, and hormonal therapy—can cause possible sexual side effects. Side effects may vary depending on the type of cancer, the specific mode of treatment, and the individual's response to treatment. Talk to your healthcare team about what you should expect from treatment.

Managing Side Effects

Below are some of the most common sexual side effects and tips for managing each.

Lack of Desire

During and after cancer treatment, many women report a lack of sexual desire. Lack of desire may come from hormonal changes such as early menopause or other side effects, making sex unenjoyable.

• Rethink what sex and intimacy mean.
  o Do not expect sex after cancer to be exactly the same as sex before cancer. Your body has been through a lot of changes.
Be patient. It may take some time to discover what is comfortable and pleasurable for you.

- Ask your doctor about estrogen therapies to increase estrogen and if they are safe for you to use.
  - Low levels of estrogen can cause female sexual dysfunction.
  - Estrogen therapies can help with lack of desire and dryness.
  - Estrogen therapies come in pills, creams, patches, and vaginal rings.
  - If your cancer is hormone driven, estrogen therapy may not be safe for you.
- If you are taking anti-depressants or pain medication, talk to your doctor about adjusting your dosage.
  - Both these medications can cause lack of desire.
- Manage other side effects such as dryness, pain, nausea, or fatigue that may be causing your lack of desire.

**Dryness**

Early menopause, triggered by chemotherapy, adjuvant therapies, or surgery, can cause vaginal dryness. Radiation to the pelvic region can also cause dryness.

- Use a water-based lubricant during sex.
  - Stay away from scented and warming lubricants. These can irritate the vagina, actually making dryness worse.
  - Do not use petroleum jelly based lubricants.
- Try vaginal moisturizers to improve overall dryness.
  - Vaginal moisturizers are different from lubricants. You do not use them only during sex. If used regularly, they improve overall dryness and vaginal health.
- As mentioned above, ask your doctor about estrogen therapies and if they are safe for you to use.

**Pain**

Pain during intercourse may occur for a few reasons such as dryness or scar tissue. Radiation to the pelvic region may cause minor burns as well as scarring that causes the vaginal canal to shrink. Gynecological surgery can damage or result in the removal of sex organs.

- After surgery, ask your doctor if and when it is safe to have sex.
- If the shape of the vagina has changed from treatment, you may need to adjust the way you have sex by trying new positions or new activities.
- After gynecological surgeries that affect the vagina, reconstructive surgery may be an option.
- A vaginal dilator can be used to stretch the vaginal canal. Vaginal dilators are smooth plastic cylinders of different widths. By beginning with the smaller ones and inserting
them into the vaginal canal regularly, the vagina begins to stretch, making intercourse less painful. Vaginal dilators also make medical pelvic exams more comfortable.

- Pain may come from dryness. If you are also experiencing dryness, try the tips above.

General pain in other parts of the body can also make sex uncomfortable and decrease your desire to be intimate. To learn more about pain management unrelated to sex, read the “Pain” section of this handbook.

**Difficulty Reaching Climax or Orgasm**

Surgery and other treatments that directly affect the pelvic region can result in loss of sensation if nerves are damaged. This can make achieving an orgasm difficult for some women. Actions that worked before treatment may no longer feel the same. Other side effects mentioned in this article such as pain, lack of desire, and emotional issues can also make achieving orgasm difficult.

- Work on managing all of side effects that may be affecting your sex life.
- For most women, vaginal penetration does not provide enough stimulation for orgasm. Extended clitoral stimulation may be needed.
- Use your mind. Make sure you are comfortable and in the right mindset for sexual activity. Try imaging sexual fantasies to get in the mood.
- Try using a vibrator to increase stimulation. Vibrators can be purchased at a drug store or discreetly online.

**Managing Non-Sexual Side Effects**

Other treatment side effects, such as nausea and fatigue, may interfere with your sex life. Manage these side effects by using the tips in this handbook.

**Self-Esteem and Body Image**

How you feel about yourself can affect your sex life. Cancer and cancer treatment can cause significant changes to your body. You may have hair loss, weight loss, weight gain, or scars. With these changes, you may not feel the same way about your body. This is all normal. Do not be critical of yourself. Your body battled cancer.

Below are tips for managing issues related to self-esteem and body image.

**Hair Loss**

- Hair usually grows back after treatment ends.
- In the meantime, try wigs, hats, and scarves.
- When your hair does begin to grow back, use a gentle shampoo such as baby shampoo.
Weight Changes

- Talk to your healthcare team about reaching and maintaining a healthy weight.
- Ask your healthcare team if it is safe for you to start an exercise program.
  - The endorphins released during exercise can also make you feel better emotionally.

Surgical Scars

- Most surgeries leave some scars. Try using over-the-counter lotions and gels to help minimize incision scars. Moisturizers made with cocoa butter also minimize scars.

Emotional Support

You have to care for your mental health as well as your physical health. If you are struggling with anxiety or sadness, you probably don’t feel like having sex. Some options for emotional support include: peer partnering programs, support groups, and one-on-one counseling. Look the “Emotional Support Programs” section of this handbook for more information.

Fertility

Cancer treatments can lead to infertility. Gynecological surgery can cause infertility. Chemotherapy and adjuvant therapies can trigger early menopause in women. Even though this process sometimes reverses in young women, it can still make conceiving difficult. Radiation to the pelvic area can damage reproductive organs.

Women do have options to preserve their fertility. However, it is important to talk to your healthcare team about fertility and your options before you begin treatment. Many fertility-preserving options must be done before the damage caused by treatment occurs.

Before beginning treatment, some women freeze and bank eggs and embryos. Fertility-preservation can be a long process so you will need to factor this into your timeframe for treatment.

Some steps can be taken to protect reproductive organs during treatment. For example, during radiation treatment, depending on the area receiving radiation, you may be able to use a shield.

If you continue to have sex during treatment, be sure to use proper protection. Pregnancy during chemotherapy or radiation is not safe for the mother or the child. Even if your periods stop during treatment, you may still be able to conceive so always use a form of birth control. Some cancers may affect your ability to use hormonal birth control methods, such as oral medication and devices such as IUDs and hormone rings. Make sure you ask your doctor before resuming any birth control you used before your diagnosis. Since cancer treatment can
compromise your immune system, be sure to always use condoms to protect against sexually transmitted diseases (STDs).

Talk to your healthcare team as soon as possible about your fertility status and options.

**Talking to Your Partner About Sexual Dysfunction**

Being able to talk openly with your partner about sex is very important. What worked for you both before cancer may not work now. You may need to try different things to find what works for you both. If it has been a while since you’ve been intimate, start slowly with simple kissing and touching. Here are some basic guidelines for talking to your partner:

- Be honest.
- Always tell your partner if something hurts or is uncomfortable.
- If something feels good, let your partner know.
- Be patient with yourself and your partner.
- Set the scene by going on a romantic date or watching a movie together at home.

**Talking to Your Healthcare Team About Sexual Dysfunction**

Your healthcare team is made up of health professionals. You should feel comfortable telling them anything. There is nothing embarrassing about sexual dysfunction, as it can happen following cancer and its treatment. After fighting cancer, you deserve to have a healthy sex life.

You may wish to talk to healthcare professionals who specialize in areas related to sexual dysfunction including:

- Gynecologist
- Endocrinologist
- Sex therapist
- Psychologist or counselor

Talking about sexual dysfunction can be difficult. Here are some sample questions to begin your conversation with your doctor:

- How will treatment affect my sex life?
- What can I do to manage sexual side effects?
- I have pain and dryness during sex. What can I do to manage this?
- I no longer feel any desire to have sex. What can I do to feel like myself again?
- Could you recommend a specialist?
- Will treatment affect my fertility?
Male Sexual Side Effects

Many male cancer patients experience sexual dysfunction or changes in their sex lives after a cancer diagnosis. These changes can be physical or mental. Many men are not comfortable discussing these issues with their healthcare team or with their partners, but being able to speak openly is important.

Common Side Effects of Treatment

Each type of cancer treatment—chemotherapy, radiation, surgery, and hormonal therapy—can cause possible sexual side effects. Side effects may vary depending on the type of cancer, the specific mode of treatment, and the individual's response to treatment. Talk to your healthcare team about what you should expect from treatment.

Below are some of the most common side effects of each treatment type that causes sexual dysfunction.

Chemotherapy

Chemotherapy does not usually directly affect sexual function, but the side effects of chemotherapy, such as nausea and fatigue, may lead to loss of sexual desire. Chemotherapy can also cause infertility. Men who plan to try to father children should ask a doctor about fertility preservation before beginning treatment.

Radiation

Radiation to the pelvic region may cause the following side effects:

- Damage to blood vessels or nerve endings leading to erectile dysfunction
- Redness and pain at the treatment site
- Fatigue which may lead to loss of desire
- Infertility

Managing Side Effects

Below are tips for managing the most common side effects related to sexual dysfunction in men.

Erectile Dysfunction

Erectile dysfunction can be either mental or physical. Your doctor can do a test to determine the cause. If the cause is mental, see the suggestions below for managing emotional issues. If the cause is physical, you have several options.

- Prescription medications can treat erectile dysfunction by increasing blood flow to the penis. (If erectile dysfunction is caused by nerve damage, medications such as these will not help.) Common medications include:
  - Sildenafil (Viagra)
  - Tadalafil (Cialis)
  - Vardenafil (Levitra, Staxyn)
• Penile injections are shots delivered before sex into the penis to help cause and sustain an erection. Your doctor may wish to do a practice injection at a healthcare office to make sure they work for you.

• A vacuum constriction device (or pump) is a plastic tube placed over the penis. Air is then pumped out of the device, creating suction. This suction causes more blood to flow to the penis.

• Penile implants are prostheses (artificial devices) surgically placed inside the penis to help create an erection. There are three main types of penile implants:
  o A semirigid penile implant is a flexible rod placed inside the penis that can be bent up or down.
  o A two-piece penile implant is made up of an inflatable cylinder inside the penis and a pump inside the scrotum.
  o A three-piece penile implant is made up of an inflatable cylinder inside the penis, a pump inside the scrotum, and a fluid supply in the abdomen.

• Being overweight may also cause erectile dysfunction. If you have gained weight during treatment, read Nutrition Tips for Managing Weight Gain.

Talk to your healthcare team about which of these options may be best.

**Lack of Desire**

During and after cancer treatment, many men report a lack of sexual desire. Lack of desire may come from hormonal changes or from other side effects that make sex unenjoyable.

• Rethink what sex and intimacy mean.
  o Do not expect sex after cancer to be exactly the same as sex before cancer. Your body has been through a lot of changes.
  o You most likely will still be able to reach orgasm. Depending on your treatment type, orgasms may no longer result in ejaculation, or you may have difficulty reaching orgasm.
  o Be patient. It may take some time to discover what is comfortable and pleasurable for you.

• If you are taking anti-depressants or pain medication, talk to your doctor about adjusting your dosage.
  o Both these medications can cause lack of desire.

• If low testosterone is causing your lack of desire, you may be able to take testosterone supplements. Talk to your healthcare team about your options.

• Other treatment side effects such as nausea, fatigue, and pain may interfere with your sex life.
  o Use the other side effect management sections of this handbook to help manage other side effects.

**Self-Esteem and Body Image**

How you feel about yourself can affect your sex life. Cancer and cancer treatment can cause significant changes to your body. You may have hair loss, weight loss, weight gain, or scars. With these changes, you may not feel the same way about your body. This is all normal. Do not be critical of yourself. Your body battled cancer.
Below are tips for managing issues related to self-esteem and body image.

**Hair Loss**
- Hair usually grows back after treatment ends.
- In the meantime, try a hat, bandana, or cap.
- When your hair does begin to grow back, use a gentle or baby shampoo.

**Weight Changes**
- Talk to your healthcare team about reaching and maintaining a healthy weight.
- Ask your healthcare team if it is safe for you to start an exercise program.
  - The endorphins released during exercise can also make you feel better emotionally.

**Surgical Scars**
- Most surgeries leave some scars. Try using over-the-counter lotions and gels to help minimize incision scars. Moisturizers made with cocoa butter also minimize scars.

**Emotional Support**
You have to care for your mental health as well as your physical health. If you are struggling with anxiety or sadness, you probably don’t feel like having sex. Some options for emotional support include: peer partnering programs, support groups, and one-on-one counseling. Other patients are often great resources for men experiencing sexual side effects of cancer. It can be difficult to talk about these issues, but having someone who has experienced the same journey can be beneficial.

**Fertility**
Cancer treatments can lead to infertility.

Men do have options to preserve their fertility. However, it is important to talk to your healthcare team about fertility and your options before you begin treatment. Many fertility-preserving options must be done before treatment begins. Before beginning treatment, some men can freeze and bank sperm. Talk to your healthcare team as soon as possible about all your options and your fertility status.

If you continue to have sex during treatment, be sure to use proper protection to protect against unplanned pregnancies and sexually transmitted diseases. Since cancer treatment can compromise your immune system, be sure to always use condoms to protect against STDs.

**Talking to Your Partner About Sexual Dysfunction**
Being able to talk openly with your partner about sex is very important. What worked for you both before cancer may not work now. You may need to start slowly and try different things to find what works for you both. If it has been a while since you’ve been intimate, start slowly with simple kissing and touching. Here are some basic guidelines for talking to your partner:

- Be honest.
• Always tell your partner if something hurts or is uncomfortable.
• If something feels good, let your partner know.
• Be patient with yourself and your partner.
• Set the scene by going on a romantic date or watching a movie together at home.

Talking to Your Healthcare Team About Sexual Dysfunction

Your healthcare team is made up of health professionals. You should feel comfortable telling them anything. There is nothing embarrassing about sexual dysfunction, as it can happen following cancer and its treatment. After fighting cancer, you deserve to have a healthy sex life.

You may wish to talk to healthcare professionals who specialize in areas related to sexual dysfunction including:

• Urologist
• Endocrinologist
• Sex therapist
• Psychologist or counselor

Talking about sexual dysfunction can be difficult. Here are some sample questions to begin your conversation with your doctor:

• How will treatment affect my sex life?
• What can I do to manage sexual side effects?
• Will I have difficulty having an erection? What can I do to manage this?
• I no longer feel any desire to have sex. What can I do to feel like myself again?
• Could you recommend a specialist?
• Will treatment affect my fertility?

Sore Mouth, Throat, and Tongue

Some cancer treatments can cause mouth sores, ulcers, and tender gums, leading to dehydration, poor eating, and weight loss. Follow these tips to manage sore throat, mouth, and tongue.

• Choose soft, bland foods.
  o Softer foods will be easier to chew and swallow.
  o Soups and stews are good options, as long as meats are soft and tender.
  o Try breakfast foods like instant oatmeal, grits, pancakes, waffles, and cold cereal that has been softened in milk.
  o Pick side dishes like cottage or ricotta cheese, macaroni and cheese, mashed white or sweet potatoes, and rice or risotto.
  o Try desserts like custard, tapioca pudding, ice cream, milkshakes, and sherbet.
  o Choose snacks like applesauce, gelatin, smoothies, and yogurt.
• Prepare foods in ways that make them easier to eat.
Cut foods into small pieces. You may consider using a blender or food processor to puree foods.
Cook foods until they are soft and tender.
Serve foods with gravy, broths, or sauces.
Choose soft or canned fruits or applesauce instead of raw fruits with tough skins.

- Avoid foods and drinks that make mouth sores worse.
  - Avoid citrus fruits and juices, salty or spicy foods, and acidic foods like tomatoes.
  - Do not drink carbonated or caffeinated drinks.
  - Refrain from having beer, wine, liquor, or any other type of alcohol.

- Avoid very hot foods.
  - Hot foods can cause mouth and throat discomfort.
  - Choose room temperature or cold foods that are soothing.
  - Allow soups and hot foods to cool to room temperature before serving.
  - Try freezing fruits, and suck on frozen fruit pops, fruit ices, or ice chips.

- Choose foods that are good sources of protein to combat weight loss.
  - Aim to have a good source of protein with meals and snacks.
  - Ground meats, eggs, cottage cheese, yogurt, custard, beans, lentils, and smoothies are good soft food choices that also provide protein.
  - Eat small, frequent meals. You may find it easier to eat smaller amounts at a time.

- Drink at least 8-10 eight-ounce glasses of water each day.
  - Drink liquids with your meals as this will make it easier to swallow foods.
  - Sip cool drinks in between your meals.
  - Drink with a straw. This can help push the foods past the painful sores in your mouth.
  - Avoid caffeinated or/and carbonated beverages.
  - Avoid alcohol. Alcohol can irritate the mouth.

- Use good mouth care.
  - Rinse your mouth several times a day. Mix ¼ tsp. of baking soda and 1/8 tsp. salt with 1 cup warm water.
  - Do not use a mouthwash that has alcohol. Alcohol makes a sore mouth worse.
  - Use a toothbrush with soft bristles.
  - Remove dentures (except during eating) if your gums are sore. Keep dentures clean.
  - Avoid cigarettes, cigars, and tobacco products.
  - Ask your doctor about special mouthwashes and sprays that can numb the mouth and throat.
  - Tell your doctor if your gums are bleeding or if you have white patches in your mouth. Both can be signs of infection.
Weight Gain

Weight gain is common among cancer patients. This can be for a variety of reasons. The following tips help maintain a healthy weight before, during, and after cancer treatment.

- Know the factors that can cause weight gain.
  - Medication, hormone therapy, or chemotherapy can lead to weight gain.
  - Fatigue and other side effects can cause decreased physical activity.
  - Stress, fear, or depression can lead to changes in eating habits.
  - Fluid retention causes swelling.
- Eat a variety of fruits, vegetables, whole grains, and beans.
  - All of these foods are high in fiber and low in calories.
  - Fiber helps you feel fuller longer.
- Choose whole grain foods.
  - Whole grains also contain fiber and are a lasting energy source.
  - Whole grain foods include whole grain breads, cereals, pasta, crackers, and brown rice.
- Choose lean proteins.
  - Protein foods also help you feel fuller longer.
  - Lean proteins include eggs, fish, skinless chicken, turkey, lean beef, lean pork, beans, and soy products.
- Choose low-fat or fat-free dairy products.
  - Low-fat and fat-free dairy products contain the same amount of protein as regular dairy products.
  - Low-fat and fat-free dairy products include 1% or skim milk, low-fat yogurt and reduced-fat cheese and cottage cheese.
- Limit foods high in fat and calories.
  - High-fat foods like regular butter, creamy dressing and sauces, sour cream, mayonnaise, fried foods, and dessert contain more calories and can contribute to weight gain.
  - Limit frequency and portions of high-fat foods and choose reduced-fat items when possible.
  - Avoid high-fat cooking methods, such as pan or deep frying. Broiling, steaming, grilling, and roasting are recommended.
- Avoid high-calorie beverages.
  - Avoid drinking large amounts of sugar-sweetened beverages such as sodas, sports drinks, sweetened teas, lemonade, and sweetened fruit juice.
  - Choose low-calorie, low-sugar beverage options such as water and unsweetened tea.
  - Limit or reduce alcohol consumption. If alcohol is consumed at all, it is best to limit to no more than one drink per day for women and two drinks for men.
- Avoid eating when you are not physically hungry.
  - Listen to your body. Don’t confuse boredom or stress for hunger.
  - Try making a list of alternate activities you can do when you have the urge to eat when not hungry.
- Watch your portion sizes.
  - Try measuring out your portions so you know exactly how much you are eating.
  - Check the nutrition label to determine serving sizes.
  - Choose to eat all meals and snacks off of a plate rather than out of the package so you can keep track of how much you are eating.
- Limit eating out.
  - Restaurants often serve large portions of higher calorie and higher fat foods.
  - Limit eating out so you are not tempted with large portions of these foods as often.
- Write down your intake.
  - Studies show that those who record all of their food and drink intake eat less calories than those who do not.
  - Keeping a food journal could help keep you mindful about appropriate portion sizes and urges to eat when not hungry.
- Try exercise.
  - Aim for 30 minutes of exercise every day if able.
  - Always discuss any changes in exercise with your physician.
- Always discuss weight gain with your physician.
  - A physician can help determine the cause of weight gain and can give recommendations for how to appropriately manage weight gain.
  - Do not go on a diet to lose weight without discussing with your physician first.

**Weight Loss**

During cancer treatment, the body needs more calories and protein, especially when side effects can make it difficult to eat. Follow these tips to increase intake.

- Eat small, frequent meals (5-6 a day) instead of 3 large meals.
  - Eat every 2 to 3 hours even if you do not feel hungry.
  - Set a timer to remind you it is time to eat. Eat the most when you feel hungriest.
  - Eat protein foods like chicken, fish, meat, eggs, nuts, and beans first.
- Use smoothies and shakes to get in calories and protein.
  - Liquids can be easier to consume than solid foods.
  - Smoothies or shakes can serve as a small meal replacement.
  - Add ingredients such as whole milk, powdered milk, protein powder, peanut butter, ice cream, or yogurt to smoothies or shakes to add calories and protein.
Premade liquid nutrition supplements are available at grocery and drug stores. Ask a registered dietitian which type is best for you.

Ingredients such as whole milk, peanut butter, ice cream, yogurt, or fruit can be added to liquid nutrition supplements.

- **Add more fats to foods to increase the calories.**
  - Fat has more calories per gram than carbohydrates or protein.
  - Use butter, oils, mayonnaise, sour cream, and salad dressings liberally.
  - When cooking, use oil or butter instead of a nonstick spray.
  - Add mayonnaise to sandwiches and tuna or chicken salad.
  - Add peanut butter or cream cheese to toast or crackers.

- **Drink most liquids between meals instead of with meals.**
  - Liquids such as water, juice, or soda while you eat can make you feel full faster.
  - Drink only small amounts with meals.
  - Drink higher calorie liquids like juice and milk between meals.
  - Drink smoothies, shakes, and nutrition supplements with or in place of a meal.

- **Snack regularly throughout the day.**
  - Keep quick and easy snacks with you.
  - Try granola bars, trail mix, peanut butter crackers, nuts, and dried fruit.
  - Keep your favorite snacks around so you will eat more.
  - Eat a bedtime snack. It will not affect your appetite at your next meal.
  - Peanut butter crackers, half a sandwich, yogurt, and cereal are good bedtime snacks.
When you are faced with a cancer diagnosis, nutrition can be an important part of your journey. Eating a well-balanced diet before, during, and after cancer treatment can help you feel better, maintain your strength, and speed your recovery. Use these tips about nutrition written by registered dietitians.

I Have Cancer. What Should I Eat?

How do I make the best food choices throughout cancer treatment?

When you are faced with a cancer diagnosis, nutrition can be an important part of your journey. Eating a well-balanced diet before, during, and after cancer treatment can help you feel better, maintain your strength, and speed your recovery.

- **Maintain a healthy weight.** Aim to avoid losing or gaining much weight during treatment. Strict dieting is not recommended during cancer treatment. Losing weight can lower your energy level and decrease your body’s ability to fight infection.
- **Eat small, frequent meals throughout the day.** Eating frequent small meals will ensure your body is getting enough calories, protein, and nutrients to tolerate treatment. Smaller meals may also help to reduce treatment-related side effects such as nausea. Try eating 5-6 small meals or “mini” meals about every three hours.
- **Choose protein-rich foods.** Protein helps the body to repair cells and tissues. It also helps your immune system recover from illness. Include a source of lean protein at all meals and snacks. Good sources of lean protein include:
  - Lean meats such as chicken, fish, or turkey
  - Eggs
  - Low fat dairy products such as milk, yogurt, and cheese or dairy substitutes
  - Nuts and nut butters
  - Beans
  - Soy foods
- **Include whole grain foods.** Whole grain foods provide a good source of carbohydrate and fiber, which help keep your energy levels up. Good sources of whole grain foods include:
  - Oatmeal
  - Whole wheat breads
  - Brown rice
  - Whole grain pastas
- **Eat a variety of fruits and vegetables every day.** Fruits and vegetables offer the body antioxidants, which can help fight against cancer. Choose a variety of colorful fruits and vegetables to get the greatest benefit. Aim to eat a minimum of 5 servings of whole fruits and vegetables daily. Fresh fruits and veggies may need to be cooked for patients with a weakened immune system.
• **Choose sources of healthy fat.** Avoid fried, greasy, and fatty foods, Choose baked, broiled, or grilled foods instead. Healthy fats include:
  - Olive oil
  - Avocados
  - Nuts
  - Seeds

• **Limit sweets and added sugars.** Foods high in added sugars like desserts and sweets provide little nutritional benefit and often take the place of other foods that are better for you.

• **Stay hydrated.** Drinking enough fluids during cancer treatment is important for preventing dehydration. Aim to drink 64 ounces of fluid daily. Avoid drinking large amounts of caffeinated beverages. Too much caffeine can lead to dehydration.

• **Practice good food safety.** Wash your hands often while preparing food. Use different knives and cutting boards for raw meat and raw vegetables. Be sure to cook all foods to their proper temperature and refrigerate leftovers right away.

• **Talk to your healthcare team before taking any vitamins or supplements.** Some medications and cancer treatments may interact with vitamins and supplements. Choose food first as the main source for nutrients.

• **Drink alcohol in moderation, if at all.** Alcohol may contribute to dehydration, can lower the abilities of your immune system, and provides no beneficial nutrients.

• **Most importantly, know that your cancer journey is unique to you and your treatment.** You may experience side effects that affect your ability to follow these suggestions. If you are struggling with any side effects, such as loss of appetite, nausea, diarrhea, vomiting, or any other nutrition concerns, your needs may be different. A registered dietitian can suggest nutrition guidelines that will be appropriate for your cancer journey.

**Nutrition and Surgery Guidelines**

The outcomes of your surgery are directly related to your nutrition status prior to and after surgery. It is very important to eat a well-balanced diet prior to surgery including fruits, vegetables, whole grains, and an adequate amount of protein. Vitamins, minerals, and protein are vital to the healing process. A single nutrient deficiency can impair the immune system causing significant delays in the healing process and a decrease in ability for the body to fight an infection. Follow these guidelines beginning at least three weeks prior to surgery or as long as possible prior to surgery to optimize your nutrition for a faster recovery:

**Eat 3-5 servings of fruits and vegetables every day. Choose a wide variety of colors.**

One serving of fruit is one piece of fruit (such as a medium orange or apple) or ½ cup of canned or frozen fruit. One serving of vegetables is ½ cup cooked or 1 cup raw. Fruits and vegetables are excellent sources of B vitamins as well as antioxidants (vitamins A, C, and E). The vitamins in fruits and vegetables support the body’s immune system before, during, and after surgery. Frozen vegetables and fruit are good to have available when shopping frequently is not possible.
Eat 6-11 servings of whole grain foods every day.

One serving is considered one slice of 100% whole wheat bread, ½ cup cooked brown rice, ½ cup whole wheat pasta, or ½ cup of whole grain cereal. Whole grains also contain B vitamins essential to building the immune system and aids the healing process.

Eat a variety of protein containing foods at meals and snacks.

Protein contains essential amino acids that are vital to the healing process. The body’s protein status prior to surgery also influences the recovery time. Good sources of protein include meat, fish, eggs, cheese, beans, nuts, tofu, and dairy products.

Use fats, oils, and sweets sparingly.

Choose healthier fats such as canola and olive oil. Avoid fried foods. Excess fat and sugar contain empty calories that do not provide the body with any nutrients. Too many empty calories and not enough nutritious food may have an effect on the immune system.

Drink plenty of water in the 3 weeks prior to surgery.

Staying well hydrated will help in the recovery process. It will also help during the period of time right before surgery that water is not allowed. A general goal for daily water consumption is eight to ten 8-ounce glasses per day.

Establish consistent eating habits.

Eat a good breakfast everyday including a good source of protein like eggs, peanut butter, or Greek style yogurt. Lunch should include a protein source, whole grains, vegetables, and fruit. The evening meal should be similar to lunch. Remember to include healthy snacks like fruit, trail mix, hummus and carrot sticks or whole grain crackers with cheese or peanut butter.

Goes grocery shopping the week before surgery.

If you are not able to go to the grocery store yourself, send someone with a list to shop for you. Shopping for healthy foods right before surgery will allow you to keep up your healthy eating plan after surgery during the recovery period. Focus more on shelf-stable items, and buy fewer perishable items. Shelf-stable items such as peanut butter, canned fruit in its own juice, and low-sodium canned soups are good to have available when you return home from the hospital.

Get some exercise.

Walking is not only good for the body it is also good for the brain. Exercise may help in “clearing your head” when you begin to get anxious. It will also help you to maintain lean body mass (muscle). Muscle loss may occur after surgery due to physical inactivity. It is important to try to get back to doing some exercise as soon as possible after recovering. Your surgeon can advise you as to when it is safe for you to resume or begin exercising.

Tell your doctor about any vitamins, minerals, herbs, or other over-the-counter products and medications you take.
Some of these may be harmful during surgery and it is best to stop taking them prior to surgery. Examples of herbal supplements to discontinue as soon as your surgery is scheduled are: echinacea, ephedra, garlic, ginger, ginkgo biloba, ginseng, kava, licorice, saw palmetto, St. John’s wort, and valerian root.

**Follow the pre-surgery instructions given by your doctor.**

The pre-surgery instructions given by your doctor are meant to help minimize complications before and after surgery. Follow these instructions carefully. Most likely there will be some restrictions on food and beverage intake as the surgery date approaches.

**Talk to a registered dietitian if you have lost weight or have any eating problems that are keeping you from eating healthy.**

A registered dietitian will assess you and make recommendations for you to optimize your nutrition prior to surgery. Sometimes a liquid nutrition supplement may be beneficial.

**Food Safety**

The immune system is weakened during all types of cancer treatment. Unfortunately, chemotherapy medications are not able to tell the difference between healthy cells and cancer cells. For this reason, perfectly healthy red and white blood cells are damaged or killed during treatment and shortly thereafter. The result of this is that body is not as good at fighting illness and infection. A common term used to refer to a very low neutrophil (white blood cell) count is *neutropenia*. Paying special attention to food safety during cancer treatment to reduce the risk of exposure to food borne illness may also be referred to a *neutropenic diet*. The following are some simple tips to reduce exposure and avoid unnecessary infection and/or illness during the time the immune system is compromised.

**Keep EVERYTHING Clean**

- Wash hands often and thoroughly especially before handling any food as well as after. Be sure to wash hands with warm water and soap for at least 20 seconds. Pay special attention to finger nails and the backs of the hands.
- Keep raw and cooked foods separate. Do not reuse any utensils, cutting boards, plates, dishes, etc. once they have been touched by raw meat or eggs. Utensils, cutting boards, plates, dishes, etc. that have been used for preparing raw meats or eggs should be washed in hot, soapy water. It is best to keep a separate cutting board for meat and fruits/vegetables. Have an extra clean cutting board available for additional preparation as well.
- When shopping for and storing raw meats, keep them away from other foods and cover the packages with extra plastic wrap or use plastic bags. This will prevent any liquids from leaking onto other foods or surfaces. Store meats and eggs toward the bottom of the refrigerator to prevent any dripping on other foods below.
Cook Food Thoroughly

- Avoid raw meat such as sushi, undercooked eggs (make sure eggs are at least “over easy” and not “sunny side up”), and other meats that have not been cooked to a proper internal temperature.
- Cook all eggs until both the white and the yolk are firm.

Use a meat thermometer to make sure that all meats are cooked to the proper internal temperature prior to eating. Here is a chart for reference:

<table>
<thead>
<tr>
<th>Meat</th>
<th>Internal Minimum Temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ground Beef</td>
<td>165º F</td>
</tr>
<tr>
<td>Turkey</td>
<td>165º F</td>
</tr>
<tr>
<td>Chicken</td>
<td>165º F</td>
</tr>
<tr>
<td>Steak or other cuts of beef</td>
<td>160º F</td>
</tr>
<tr>
<td>Whole chicken, turkey, duck, or goose</td>
<td>180º F</td>
</tr>
<tr>
<td>Pork</td>
<td>170º F</td>
</tr>
<tr>
<td>Egg dishes</td>
<td>160º F</td>
</tr>
<tr>
<td>Casseroles</td>
<td>165º F</td>
</tr>
<tr>
<td>Reheated leftovers</td>
<td>165º F</td>
</tr>
</tbody>
</table>

Foods To Avoid

- Raw or undercooked meats
- Unpasteurized milk and juices
- Soft cheeses made with unpasteurized milk such as feta, blue cheese, Roquefort, Stilton, brie, or Farmer’s cheese
- Processed meats such as luncheon meats as well as anything else from a deli counter
- Refrigerated meat spreads or paté
- Smoked fish or precooked shrimp or crab meat
- Sprouts such as bean sprouts, alfalfa sprouts, or broccoli sprouts
- Pre-cut fresh fruit and vegetables. Buy them whole, wash, and cut them yourself using proper sanitary techniques as outlined above.
- Unwashed fresh fruits and vegetables
- Unroasted or raw nuts and seeds
- Raw tofu or tempeh
- Food from salad bars of buffets
- “Fresh” salad dressings, salsas, sauces, etc. sold in the refrigerated section of the grocery store.
- Raw apple cider
• Raw honey
• Unrefrigerated cream filled pastries

The guidelines above were created with those who have severely weakened immune systems in mind. Consult your physician or health care team for regular updates on your blood counts and the status of your immune system.
Must Have Grocery List

It’s always important to have good, healthy foods on hand, especially if you are fighting cancer or are a cancer survivor. Eating well during cancer treatment can help to improve your overall health, improve your response to treatment, and maintain good health during treatment and recovery. Having a well-stocked pantry can assure that you are getting the calories and nutrition your body needs. Below are some suggested items that are healthy kitchen staples.

**Pantry**

**Grains**
- Whole grain breads, English muffins, pita bread, flour or corn tortillas
- Crackers: saltines, club crackers, whole wheat crackers, graham crackers
- Whole grain brown rice or white rice
- Whole wheat and refined pastas such as, penne, bowtie, macaroni, egg noodles, etc.
- Quick cooking oats and steel cut oatmeal
- Couscous, bulgur, or quinoa
- Cream of wheat
- Grits
- Dry cereal
- Natural popcorn
- Flour, cornmeal, breadcrumbs

**Fruit/ Vegetables**
- Canned fruit
- Dried fruit
- Individual fruit cups
- Applesauce, no sugar added
- Potatoes and sweet potatoes
- Onions
- Garlic
- Canned tomatoes (diced, whole), tomato sauce, marinara sauce
- Canned no salt added vegetables
- Instant mashed potatoes

**Dairy**
- Nonfat dry milk powder or whey protein powder
- Evaporated Milk
Proteins
- Canned tuna, salmon, or chicken (Choose those packed in water, not oil.)
- Natural peanut and almond butter
- Unsalted nuts and seeds
- Canned or dried beans, vegetarian refried beans, lentils.
- Protein bars

Fats and Oils
- Oil, olive, canola, cooking spray

Other
- Canned low sodium soups
- Low sodium chicken, beef, or vegetable stock
- Dried herbs and spices
- Vinegars such as red wine and balsamic
- Decaffeinated teas
- Flavored drink mixes, lemonade
- Pudding or gelatin mixes
- Individual pudding or gelatin cups
- Honey, sugar, stevia

Refrigerator:

Fruits/Vegetables
- Fresh and jarred fruits and vegetables
- Packaged salad mixes such as spinach, romaine and arugula

Dairy
- Low-fat milk,
- Low-fat plain or Greek yogurt
- Cheese slices, cheese sticks, shredded or crumbled cheese
- Reduced fat cottage or ricotta cheese
- Fortified soy, almond, or rice milk

Proteins
- Eggs
- Skinless chicken breasts or ground chicken breast
- Lean pork
☐ Lean cuts or lean ground beef
☐ Ground turkey or turkey breast
☐ Nitrate and nitrite-free deli meats
☐ Hummus

**Fats and Oils**
☐ Mayonnaise
☐ Salad Dressings
☐ Reduced

**Other**
☐ Beverages- 100% juices, tea, sports drinks, liquid nutrition supplements
☐ Fat-free sour cream
☐ Lemon juice, lime juice
☐ Sauces and condiments like low sodium soy sauce

**Freezer:**

**Grains**
☐ Frozen whole grain waffles
☐ Whole grain breads, rolls, English muffins, bagels, etc.

**Fruits/ Vegetables**
☐ Frozen vegetables and fruits
☐ Frozen juice concentrate (100% juice)

**Dairy**
☐ Frozen desserts: sherbet, frozen yogurt, ice cream

**Proteins**
☐ Chicken breasts
☐ Fish such as tilapia, salmon, flounder
☐ Shrimp

**Other**
☐ Popsicles
A cancer diagnosis brings with it practical concerns such as financial, emotional, and legal issues. If possible, it is best to address these concerns before you begin treatment because you may not want to deal with these issues when you are not feeling well. In the next few sections, you will find information on the following:

- Preparing financially for cancer
- Legal considerations
- Hospice and palliative care
- Finding emotional support

Financial Concerns and Cancer

A cancer diagnosis can cause financial concerns. Even if you have insurance, there are things you need to think about. Here are the questions you need to ask before you start treatment:

**Am I insured? Is my insurance going to cover the cost of treatment?**

- Before you begin treatment, take a look at your insurance plan to see what starting treatment will cost you.
- A portion of costs will be “out of pocket” with any insurance plan.
  - See if you can get this cost automatically taken out of your bank account or pay check or paid with a credit card.
- You have to meet your deductible before your insurance company will pay for care.
- As soon as possible, determine what your co-payment will be for each appointment and treatment.
  - Use this to make a budget for future treatments and doctor appointments
- Most insurance plans have the option for cancer patient to be assigned a case manager.
  - Be sure to ask for this service.
  - This person will be able to answer all your questions.
  - If your insurance company does not have a case manager service, ask to speak to the same representative each time you call.
  - If your insurance is through your employer, someone in HR will be able to answer questions about your coverage.
- You may need to find a supplemental program to cover fees that your primary insurance does not.

**What if I don’t have insurance?**

- State Medicaid: www.cms.gov
Can I afford treatment? What other expenses can I expect?

- Before you begin treatment, ask the billing department for the expected cost.
  - When you begin, your doctor will give you a treatment plan.
    - For example, you will do a certain number of rounds of chemotherapy or a certain number of weeks of radiation.
  - Take this plan to the billing department to get an estimate of the cost of your prescribed treatment plan.
  - The more information you get the better you can prepare.
- Ask the billing department if there are any ways you might be able to save money.
  - Many providers will give you a discount if you pay in full.
  - Ask if you can set up a payment plan where you pay a certain amount each month towards your bill.
- You will need to change your current budget to include costs related to your cancer diagnosis and care.

Are there options for treatment that are less expensive? Are these options just as effective? Am I eligible for a clinical trial?

- Ask your doctor and healthcare team these questions.
- Be sure to discuss all your treatment options with your healthcare team.
- Clinical trials are not more or less expensive than other treatments. Many insurance plans cover clinical trial treatments. Ask your doctor and healthcare team for more information.

Does my hospital or treatment center have options for financial assistance? Is there assistance I can apply for? Does my hospital have a reduced cost program? If so, what are the eligibility requirements?

- Many hospitals have options for financial assistance.
- Ask if there is someone you can talk to about your options.

What other costs should I expect?

- Additional expenses you need to consider include:
  - Transportation
  - Child care
  - Nutritional supplements
  - Additional prescriptions
  - Prostheses (artificial body parts) or wigs
  - Household chore services (cleaning, grocery shopping, etc.)
10 Financial Assistance Tips for Cancer Patients

Whatever your financial situation, a diagnosis of cancer can complicate your budget. Review these tips for greater financial peace of mind.

1. **Understand your current and upcoming financial situation.**
   - Use the budgeting worksheets in this handbook to help you understand your regular income and expenses. Doing so can ensure that you are not blindsided by the impact of any extra expenses.
   - Learn about the costs of your treatment plan. Before you begin treatment, your doctor will prescribe a certain treatment plan; for example, a certain number of weeks of chemotherapy. The billing department of your doctor’s office or treatment facility may be able to give you an estimate.

2. **Ask your doctor if there are more affordable options for treatment.**
   - Start with these questions: Are there less expensive treatment options? Would these options be as effective?

3. **If you do not already have a system for handling your finances, now is the time to develop one.**
   - Decide how you will keep track of your finances moving forward. Will you keep handwritten records? Will you use a computer program? Set aside a day and a time every month to pay your bills (or weekly if needed).
   - Ask a financial planner for help; your bank may have a customer service agent who is helpful.

4. **Keep accurate records of all medical bills, insurance claims, payments, and receipts, as well as any mail regarding those items.**
   - Get a notebook or special folder to keep track of everything in one place.

5. **When looking for financial assistance, always start with your doctor’s office.**
   - Practices often have financial assistance and options for uninsured and underinsured patients. Your doctor’s office may also have a social worker or patient representative who can help you identify resources.
   - Be sure to request any applications or possible services offered.

6. **When contacting the billing department, ask to speak with the same representative each time.**

7. **When asking for assistance, see if the billing department is willing to set up a payment plan for you.** You may get a discount if you are able to pay your bill in full at the time of service.

8. **Working with your insurance company and understanding your coverage will help you know all your options.**
   - Many insurance companies offer case managers for diagnoses like cancer.

9. **Look to nonprofit organizations for help.**
• Many national organizations have local branches that may be able to help with specific costs. The assistance might not be much, but every little bit can help.

• Examples of organizations include: churches, American Cancer Society, CancerCare, Salvation Army, and the United Way.
  o American Cancer Society: (800) 227-2345
  o CancerCare: (800) 813-HOPE (4673)
  o United Way: Dial 211 or visit www.211.org or www.unitedway.org.

10. If you realize you are going to be late making a payment, be sure to call your creditors as soon as you can and let them know of your situation.

• Some companies like your credit card or mortgage company might temporarily change your payment requirements or interest rate.

Managing My Health Insurance

Even with insurance, the cost of cancer is high and often requires lots of visits with primary care doctors and specialists for labs, tests, and treatment. Your insurance may not cover the cost of everything. You will also have out-of-pocket costs such as co-pays and deductibles that may build up. To stay on top of these, make sure you know what to expect ahead of time. Here are some tips for navigating your health insurance and the cost of cancer care:

Be familiar with your health insurance policy.

Learning about your health insurance can be a very daunting task. The best place to find out about your policy is through your health insurance company.

• If possible, see if your provider will assign to you a case manager. If not, ask to speak with the same representative each time you call. This will make communication easier for both you and the representative.

• If your insurance is through your employer, you can also contact your Human Resources representative with any questions.

Know what you are expected to pay.

Before you start treatment, take a look at your insurance plan and see what is covered and what additional costs you will need to pay.

• A portion of the costs will be out-of-pocket regardless of your insurance plan.

• See if there is an option to get this cost automatically taken out of your bank account or pay by check or with a credit card.

• Most health insurance companies have a deductible. A deductible is the certain amount that you will have to pay before the insurance plan will start paying. Even with the deductible met, you may have to make co-payments.
Always look in advance into what your co-payment will be for each appointment and treatment.

Make a budget.

Use coverage, co-pay, and deductible information to make a budget for future treatments and doctor’s appointments. This is also a good way to plan your new budget and not be surprised by the additional costs.

- Use the budgeting worksheets provided at the end of this handbook.

Submit everything to your insurance company.

Submit all of your medical expenses, regardless if you think your insurance company will cover it or not. The only way to get an expense covered is to submit it. It is better to ask and be turned down than spend unnecessary money out-of-pocket.

Look for financial assistance.

If you are still having trouble managing costs, look to financial assistance programs. Forms of assistance include co-pay as well as premium assistance and prescription assistance programs. All financial assistance is usually dependent on income and cancer type.

The Patient Advocate Foundation may be able to assist with co-pays. Call 1-800-532-5274 for more information.

The Basics of Medicare

Medicare is an insurance program run by the United States government. Medicare is for people who

- Are 65 years and older and are eligible for Social Security benefits
- Are receiving Social Security Disability Insurance and have completed a 2-year waiting period for Medicare
- Have Railroad Retirement/Disability benefits
- Have end-stage renal disease or Amyotrophic Lateral Sclerosis

Medicare has 4 types of possible coverage.

Part A (Hospital Insurance): Part A covers inpatient care. It is free for most Medicare recipients. The services covered by Part A include hospital care, skilled nursing facility care, nursing home care, hospice, and home health services.

Part B (Medical Insurance): Part B covers medically necessary services, meaning services or supplies that are needed to diagnose or treat your medical condition and meet accepted
standards of medical practice. Part B also covers preventive services such as healthcare to prevent illness or detect it at an early stage when treatment is most likely to work best. These services include clinical research, ambulance services, durable medical equipment, mental health, second opinion, and limited outpatient prescription drugs. Part B of Medicare does come at a cost. In most cases, participants pay a premium of about $105 a month.

Note: Part A and B usually cover 80% of costs for individuals, leaving 20% left for the individual to pay. (For example, if your bill is $4,000, Medicare would pay $3,200 and you would pay $800.) With this type of Medicare, there are Medigap programs to cover the additional 20%. These programs have a limited enrollment period; if that period is missed, you may lose access.

Part C (Medicare Advantage Plans): Part C plans are offered through private companies approved by Medicare. These plans cover all the services provided by Medicare Part A and Part B. These plans vary depending on location and have their own set premiums, deductibles, and co-pays.

Part D (Prescription Drugs): Part D may be covered by your premium if your income is below a certain amount. Otherwise, you will pay according to your income (no more than $69.30 a month).

If the cost of Medicare is too much, look to Medicare.gov for options to help pay your costs. Medicare.gov is also a great resource to look up what is specifically covered by Medicare.

I Am Uninsured. What Are My Options?

If you are uninsured or underinsured and have been diagnosed with cancer, you should know your options for health insurance and reduced-cost medical care.

Medicaid:

Medicaid is an insurance program for those who are low income and meet the eligibility requirements. Medicare is funded by state and federal government.

- Eligibility depends on what state you live in because each state individually runs its own program.
- Visit your local government website or Department of Human Services for more information.
- Medicaid programs have strict rules about who can qualify. If someone in your household is able to work, you may not be able to receive Medicaid.
- Medicaid programs often include:
  - Children
  - Pregnant women
- Social Security insurance recipients
- People diagnosed with some cancer types

- Even if you are in one of the above categories, you will still need to qualify based on your income.
- Under the Affordable Care Act, many states expanded their Medicaid programs to include almost all adults with an income below 138% of the federal poverty limit. For example, if two people live in your household and have a combined income of less than $21,707, you may qualify.
- For the most up-to-date information on these expansions, visit healthcare.gov and the Kaiser Family Foundation at kff.org.

COBRA:

The Consolidated Omnibus Budget Reconciliation Act (COBRA) was created to allow some people to temporarily keep insurance coverage if there are changes in their employment. The program allows you to keep your former job’s insurance by paying the full price of the insurance to your employer (not the reduced rate you paid as an employee).

- Examples of employment changes include the following:
  - Being fired or laid off from your job
  - Voluntarily leaving your job
  - Having your hours reduced, making you ineligible for insurance
  - Having health insurance through a spouse’s job and he or she died, or you are now divorced or separated
- COBRA is a very expensive option and may seem unaffordable, but COBRA can buy you some time. If you have cancer, your medical bills from being uninsured could be more than COBRA.
- If you are eligible but have not signed up for COBRA, you may be able to pay past premiums and obtain COBRA coverage.

Affordable Care Act:

The Affordable Care Act (ACA) was signed into law in 2010. The ACA changed a lot of the laws of the U.S. healthcare system. The goal of the ACA was to increase the quality and affordability of healthcare in the U.S. As part of the ACA, people can sign up for health insurance through the government-run healthcare marketplace if they do not have insurance through their employers or another source.

- Now that the March 31, 2014, enrollment deadline has passed, the only way to apply for coverage through the ACA marketplace is to see if you qualify for a special enrollment period.
• The enrollment period for 2015 will begin on November 15, 2014. In the meantime, you can look to healthcare.gov to see if you might qualify for a subsidy and what your deductible and premiums might be.
• Now that insurance companies can no longer disqualify individuals based on pre-existing conditions, the marketplace has multiple options that are great for those with a cancer diagnosis.
• If you are under 26 years old, you can still be on your parent’s health insurance plan.
• Your options through the marketplace depend on where you live. It is best to check the marketplace directly to see your individual options. Visit healthcare.gov for more information.

Local Health Department and Local Free Clinics:
• Look to local free clinics to get your medical treatment.
• You can also do a search of free clinics in your area at The National Association of Free & Charitable Clinics at www.nafcclinics.org/clinics/search.
• In addition to free clinics, there are approximately 170 healthcare facilities that still provide free or reduced cost services under the Hill Burton free and reduced cost healthcare law.
• You must apply at the admissions office of the participating hospital to determine if you meet eligibility requirements.
• For more information, visit the US Department of Health and Human Services at www.hrsa.gov.

Finding Transportation

Transportation to and from treatment can be difficult to find and maintain. Some first steps to finding reliable transportation include the following:

• Always begin by asking your healthcare team if your treatment center provides transportation assistance.
• Try calling your insurance provider. Some insurance plans also provide help with transportation to and from treatment.

If neither of these options is helpful, try some of these resources:

The American Cancer Society’s Road to Recovery

The American Cancer Society offers a volunteer-run service called Road to Recovery. This service provides transportation to and from treatment for people who have cancer and do not have a ride or are unable to drive themselves. Because this service is run by volunteers who
donate their time and use their own cars, the drivers cannot usually drive long distances. Call (800) 227-2345 to learn how to schedule a ride in your area.

Public Transportation

Bus systems and local public transportation are good options. Most public transportation systems have door-to-door service options for medically needy and handicapped individuals. Note, however, that your healthcare team may advise you not to use public transportation if you have a weakened immune system.

Financial Assistance to Cover Gas Costs

If you are able to drive and have to travel a long distance, you may be able to find financial assistance to cover the gas costs of transporting yourself. There are multiple resources for this assistance including the American Cancer Society, CancerCare, and Grind for Life. These resources can provide a limited amount of financial assistance for the cost of gas or other costs of travelling, such as bus passes or the cost of medical transport. Also check with your treatment center. Sometimes local organizations provide gas cards directly to treatment centers to distribute.

You can contact the organizations listed above using the following information:

- American Cancer Society: (800) 227-2345 or cancer.org.
- CancerCare: (800) 813-HOPE (4673) or www.cancercare.org.
- Grind for Life: (561) 252-3839 or www.grindforlife.org.

Free or Reduced-Cost Flights

Sometimes getting to treatment also includes having to fly for treatment. Angel Flight is an organization that provides free air transportation for medically necessary trips. They are a nonprofit of pilots and volunteers. You can contact Angel Flight by calling (918) 749-8992 or visiting www.angelflight.com.

Finding Lodging

A cancer diagnosis may require you to travel for doctor appointments and treatment. Some forms of treatment require you to visit a treatment center for multiple days in a row for weeks at a time. There are a couple of options to consider when having to make these kinds of extensive trips.

Checking with Your Treatment Center

If you need assistance finding or paying for lodging, tell your healthcare team as soon as possible. Some treatment centers have lodging coordinators especially if the center treats a lot
of patients from out of town. Treatment centers may also have their own lodging such as a hospitality house. Ask your healthcare team if your treatment center has resources to help with lodging.

**American Cancer Society’s Hope Lodge**

The American Cancer Society (ACS) sponsors Hope Lodges in most major cities throughout the country. It is free to stay at all the Hope Lodge locations. If you have an ACS Hope Lodge in your area, your oncology nurse or social worker should be able to help with the application process. This resource is not for those who are homeless. ACS will check to make sure you have somewhere to stay once you have checked out. To contact the American Cancer Society, call **(800) 227-2345** or visit www.cancer.org.

**Hotels with Medical Rates**

For discount lodging, hotels with medical rates are a great option. Most major hotel chains offer medical rates for those who are travelling for medical treatment. Make sure you book your rooms in advance. The hotel may require proof from your doctor that you are traveling for medical reasons.

**Joe’s House**

The nonprofit Joe’s House provides an online nationwide database of places that offer lodging for cancer patients. Check out their website to determine options in your area. You can search by state, city, and even treatment center. The search results include nonprofit lodging as well as hotels that provide medical discounts. Visit Joe’s House at www.joeshouse.org.

**What Do I Need To Know About Social Security Disability Benefits and Cancer?**

Do you have a cancer diagnosis? Are you no longer able to work? You may qualify for Social Security Disability benefits.

The Social Security Administration (SSA) offers financial assistance in the form of Social Security Disability benefits. **A cancer diagnosis does not automatically make you eligible for SSA benefits.** You have to apply. Here is what you need to know about Social Security Disability benefits and cancer:

- Social Security Administration (SSA) and Social Security Disability benefits
  - To qualify, you must meet the SSA’s definition of disability.
    - A cancer diagnosis does not automatically meet the SSA’s definition of disability.
    - The SSA processes cancer disability claims on a case by case basis.
    - You must prove you cannot work for at least one year because of your diagnosis.
    - You need proof from your doctor that you cannot work.
- People who have stem cell or bone marrow transplants automatically meet the definition.
  - In cases of advanced stage cancer, you may qualify for “Compassionate Allowance.”
  - This allows applicants to qualify for benefits in as little as ten days.
  - Apply as soon as possible. The SAA denies most disability claims at first. You can appeal the decision.
  - You can fill out the forms online at http://www.ssa.gov/ or at your local Social Security Office.

The SSA offers two types of disability programs.

1. Social Security Disability Insurance (SSDI)
   - You must have worked jobs in which you paid Social Security taxes.
   - You must meet the SSA’s definition of disability.
   - People approved for SSDI are eligible for Medicare after a two year waiting period.
   - SSDI is not health insurance.

2. Supplemental Security Income (SSI)
   - SSI is a needs-based program. You must prove your income and assets are below the limit.
   - You do not need work credits to qualify.
   - You must meet the SSA’s definition of disability.
   - SSI is also available for individuals over 65 without a disability who meet the financial need requirement.
   - People approved for SSI automatically qualify for Medicaid.
   - In some cases, you may qualify for both SSDI and SSI.
   - SSI is not health insurance.

To check your eligibility for all SSA programs, use the Benefit Eligibility Screening Tool (BEST) at http://www.benefits.gov/ssa. Based on your answers, this tool lists benefits you may be eligible to receive. This tool does not guarantee approval.

For more information you can also call the Social Security Administration at (800) 772-1213.

Advanced Directives

Advanced directives or an advance care plan are legal papers. These papers tell your family and healthcare team your medical wishes. They are used in case you cannot make a medical decision. For example, if you are unconscious, your healthcare team and family will follow your advanced directives.

Advanced directives may differ by state. Your hospital or treatment center can give you the forms. Be sure to give your family members and healthcare team a copy of your advanced directives. If you change your mind about the kind of treatment you prefer, you can change your advanced directives.
Advanced directives may include living wills, medical power of attorney, or DNR orders. Here is a list of things to consider for your advance care plan:

- Life support or use of equipment such as dialysis machines, ventilators, and respirators
- DNR (Do Not Resuscitate)
  - DNR orders tell your healthcare team not to do CPR if your heart or breathing stops.
    - CPR (cardiopulmonary resuscitation)
      - First aid used when your heart or breathing stops. CPR can include chest compressions, electric shock, or medication.
- DNI (Do Not Intubate) orders
  - DNI orders tell your healthcare team not to put a tube through your nose or mouth to help you breathe.
- Artificial nutrition and hydration
  - If you are unable to eat or drink, your healthcare team will provide you with nutrition and fluids through an IV or feeding tube.
- Treatment of new conditions
- Organ and tissue donation
- Medical Power of Attorney
  - Medical power of attorney lets you name another person, such as a family member or close friend, who can make decisions about your medical care if you cannot.
  - This may also be called a healthcare proxy, appointment of healthcare agent, or durable power of attorney.
  - Most states will not allow anyone on your healthcare team to be your medical power of attorney.

A cancer diagnosis can be a stressful time. It may be scary to consider these issues before you are very sick. However, it is important to think about these issues early. You will not want to deal with them when you are feeling very ill.

Palliative and Hospice Care

At some point in your cancer journey, you may need to consider palliative care or hospice. Palliative care is a treatment that helps relieve pain and symptoms but does not provide a cure. Palliative care can be used along with your prescribed cancer treatment. Hospice is a type of palliative care. Specifically, hospice is end-of-life care. Both palliative care and hospice aim to improve quality of life. Talk with your healthcare team about what is best for you. Below you will find more information about hospice and palliative care. Use the questions at the end to guide talks with your healthcare team.

- **Palliative care**
  - Palliative care helps relieve pain and symptoms but does not provide a cure.
  - You may use palliative care at any point during your cancer journey. A patient does not have to be terminal to receive palliative care.
  - Palliative care can be combined with other forms of treatment.
  - You may use palliative care to manage side effects from treatment.
Some forms of palliative care may be covered by Medicare, Medicaid, or other insurance plans. Often, costs for palliative care fall on the individual.

- **Hospice**
  - Hospice is a type of palliative care.
  - Hospice is end-of-life care. Terminal patients with a life expectancy of six months or less often use hospice.
  - Hospice care is not usually given at the same time as other curative treatments. Hospice is given after treatment options have been exhausted.
  - Medicare pays for all hospice costs. In most states, Medicaid pays for hospice costs. Most other insurance plans have hospice benefits.

- **Questions to Ask Your Healthcare Team**
  - Should I consider palliative care now or in the near future?
  - Will my insurance cover my palliative care?
  - How long can I get palliative care?
  - Where will I get my palliative care?
  - Can I still do treatment for my illness while doing palliative care?
  - Should I consider hospice care now or in the near future?
  - Will insurance cover my hospice care?
  - If my life expectancy is longer than six months, can I still get hospice care?
  - Can I get hospice care in my home?
  - Who will be caring for me? Will they be doctors, nurses, social workers, or home health aides?
  - What legal issues such as advanced directives, living wills, or medical power of attorney should I think about?

**Emotional Support Programs**

A cancer diagnosis can make you feel anxious and depressed. This is normal. It may help to talk to someone. It can be especially helpful to connect with other survivors and patients. You are not alone in your fight. You may find it helpful and inspirational to hear others’ stories. You may also be able to help someone else by sharing your story. Here is some information about available emotional support:

- **Support groups**
  - Connects you with a group of people in a similar situation
  - Support groups meet on a regular basis.
  - Support groups meet online, over the phone, or face-to-face.
  - Ask your healthcare team about local support groups.
  - Licensed social workers or other medical professionals facilitate most support groups.
  - Support groups can be for current cancer patients, survivors, or family members.
  - Some groups are defined by diagnosis, age, or sex.
  - A support group is meant to help you through your cancer journey. The first support group you go to may not be the right fit for you. If you do not enjoy the first group, try another.
Where can you find support groups?
- Your hospital or treatment center
- Your local American Cancer Society chapter
  - Visit cancer.org or call (800) 227-2345.
- Cancer Support Community
  - This includes The Wellness Community and Gilda’s Club.
  - Visit cancersupportcommunity.org or call (888) 793-9355.
- CancerCare
  - Visit cancercare.org or call (800) 813- HOPE (4673).

Connect with a Fellow Survivor
- One-on-one partnering programs will match you with a fellow cancer survivor. This person may have a similar diagnosis and may be finished with treatment.
- These allow for a more personal connection.
- Most programs are for family members as well as patients.
- Usually these programs are run through phone or email.
- How can you connect with a fellow survivor?
  - Imerman Angels
    - Visit imermanangels.org or call (877) 274-5529.
  - Cancer Hope Network
    - Visit cancerhopenetwork.org or call (800) 552-4366.

Individual Counseling from a Medical Professional
- If you find it difficult to function in your daily life because of anxiety or depression, you may need individual counseling from a medical professional.
  - Ask your healthcare team for a recommendation.
  - Visit CancerCare for more information.
Even after treatment ends, your cancer journey continues. Many cancer survivors refer to the time after treatment ends as the “new normal.” It may take you a while to readjust to life after treatment. You may wish to make changes in your nutrition and lifestyle to help prevent recurrence. Use these sections to help you navigate your “new normal” and to promote wellness during survivorship.

Follow-Up Care

Follow-up care after completing cancer treatment is very important. Your healthcare team will help you manage long term side effects and watch for any changes such as the cancer spreading or coming back. Here are some things to remember about follow-up care:

- Always go to your follow-up appointments.
  - You will probably have follow up exams every 3-6 months following treatment depending on the stage of your cancer.
  - After some time goes by without a recurrence, your healthcare team will probably recommend checkups only once or twice a year.

- Follow your recommended screening schedule.
  - Your screening scheduled will depend on the type and stage of your cancer and other aspects of your medical history.
  - Typically a few months after treatment your doctor will order an imaging scan such as a CT scan, PET scan, or MRI to set a new baseline. Your doctor will use this image to compare with future scans to check for recurrence.
  - At most appointments with your oncologist you will have a lab visit first to do blood tests. Your oncologist uses these blood tests to check for tumor markers, protein levels, blood cell counts, and general health.

- If you change your primary care physician, make sure your new doctor has all your medical records and history.

- Tell your doctor about any side effects.
  - Some side effects occur after treatment ends. Let your healthcare team know of any and all changes so they can help you manage them effectively.

- Keep your health insurance if at all possible.
  - Follow-up care, especially imaging, can be very expensive if you do not have health insurance.

Survivorship Nutrition
Once cancer treatment is complete it is time to restore and rejuvenate the body by feeding it with the best foods for optimal nutrition. Nutrition status, physical activity, and body weight all play a role in preventing cancer recurrence. Here are some guidelines to follow while adopting a new lifestyle now that cancer treatment is over.

**Eat a wide variety of colors of fruits and vegetables every day.**

- Fruits and vegetables contain phytochemicals that fight against cancer. Each color contains a different phytochemical. A wide variety of colors introduces more types of these cancer fighting chemicals into the body.
- Choose organic varieties when available to limit exposure to chemicals and pesticides. Wash all fruits and vegetables very well.
- The most important fruits and vegetables to buy organic are those that are conventionally grown with the most pesticides. These are often referred to as the “dirty dozen.”
- Frozen fruits and vegetables are a great alternative to fresh and are easy to have available when time for shopping is limited.

**Choose complex carbohydrates for increased energy.**

- Select complex carbohydrates like whole grains (oats, wheat, brown rice, whole grain pasta) and whole fruits and vegetables.
- Complex carbohydrates are digested slowly due to their high fiber content, providing sustained energy.
- Choose grain products that have whole wheat or a whole grain flour listed as one of the first 3 ingredients.
- Avoid highly processed and refined grains (white enriched flour, baked goods, snack foods, sweets).
- A serving of whole grain is one slice of bread, ½ cup of cooked rice or pasta, and ½ cup of whole grain cold cereals and oatmeal.

**Choose lean protein most of the time.**

- Choose lean proteins that include beans, eggs, white meat chicken and turkey, and fresh fish (not farm raised). When available, select organic and locally farmed. Other good sources of protein are nuts, and tofu.
- Limit red meat to less than 18 ounces per week. Red meat includes beef, pork, and lamb. For reference, one ounce of meat contains 7 grams of protein. To make sure that you are getting enough protein, aim to eat a source of protein at every meal.

**Incorporate good fats into meals and snacks.**

- Eliminate fried foods and eat foods that are high in omega-3 fatty acids such as avocados, fish, and nuts.
- Avoid trans fats and avoid foods containing partially hydrogenated oils.
Limit sweets and simple sugars. Avoid artificial sweeteners.

- Choose fruit to satisfy cravings for sweets. Sweets provide our body with empty calories and no nutritional value.
- Stevia is a plant-based natural sweetener that is an acceptable alternative to sugar, or artificial sweeteners like aspartame sucralose, and saccharin.

Drink plenty of water.

- Staying hydrated is essential to rejuvenating the body. Too much caffeine may lead to dehydration.
- Green tea and white tea are also good beverage options for staying hydrated.
- Aim for 64 ounces of caffeine free fluids per day. If you are not drinking any water, start slowly and gradually increase water intake.

Eat consistently throughout the day to avoid overeating.

- Five to six small meals per day eaten every 2-3 hours help to keep blood sugar levels more stable.
- Smaller, more frequent meals help with weight management by encouraging metabolic rate to increase.
- Smaller, more frequent meals allow for better absorption of nutrients.

Achieve and maintain a healthy body weight for your height.

- Eat healthy by following the guidelines on this handout.
- Consult with a registered dietitian to determine individual energy needs and a realistic goal weight.
- Monitor food intake and measure portion sizes.
- Begin to track food intake in a journal.

Exercise

- If not currently exercising, gradually work toward 45-60 minutes daily. This can be split up into 10 or more minute increments to make it more possible when time is a factor.
- Be realistic and start slowly. A regular exercise program may help to minimize stress and depression.
- Choose an enjoyable activity. Enlist a friend or relative as an accountability partner.

Nutrition Supplements

- Choose food first as the primary source for vitamin and minerals. Ask a registered dietitian for guidance on vitamins, minerals, and other nutrition supplements.
- Do not rely on supplements for cancer prevention.
Drink alcohol in moderation, if at all.

- Alcohol is a contributing factor to many types of cancer.
- Alcohol provides the body with calories but not any nutrients.

Fear of Recurrence

Many believe that once treatment ends, the cancer journey is over, but that’s not the case. Many cancer survivors struggle with the fear of recurrence. What if my cancer comes back? What if my cancer spreads? For some, these fears can become overwhelming even years into remission. These fears are completely normal, but there are things you can do to try to manage them.

Take charge of what you can.

You may feel afraid because of the lack of control you have over the situation. To take back some control in your life, try making positive changes.

- Talk to a registered dietitian about developing a survivorship nutrition plan. Good nutrition can reduce your chance of recurrence and make you healthier all around.
- Start an exercise program. Exercising is not only good for your body; it is also good for your mind. Exercising releases endorphins, natural chemicals that make you feel happier. Many people also say exercising helps clear their minds and lower stress. Always talk to your doctor before starting any exercise program.
- Stay on top of your screenings and checkups. At the end of your treatment, work out a screening and checkup plan with your oncologist. What kind of scans or tests do you need? How often do you need them?

Take a deep breath.

If you feel yourself starting to get worked up, close your eyes, take a deep breath, and count to ten. This may seem like silly or old advice, but taking a second to gather your thoughts can make you feel a lot better.

Try meditation or visualization. Find a quiet, comfortable spot in your home. Take a few moments to yourself to breathe deeply and reflect on the positive things in your life. Think about some of your goals, even simple ones, and imagine yourself reaching them. In the rush of everyday activities, we sometimes forget to just breathe.

Find a hobby.

Hobbies can be a great source of entertainment and can also take your mind off of negative things. Try one of the hobbies listed below or make up one of your own. Find something that you enjoy and are passionate about.

- Knitting
- Cooking
- Painting
Volunteer.
Volunteering can be a worthwhile way to pass your free time and make a difference in your community. Is there a cause you are passionate about? Education, the environment, animals. To find a variety of volunteer opportunities in your neighborhood, visit VolunteerMatch.org or Volunteer.gov.

A quick word of caution: For some, volunteering for a cancer support organization may hit too close to home. Consider how it may affect you to be in this environment with constant reminders of your experience. You need to do what is best for you. If you are unsure how it may affect you, volunteer once before committing more time.

Talk about it.
You may find it helpful to talk to someone. It can be especially comforting to connect with other survivors. Hearing other survivors’ stories can show you what you are feeling is normal, and you are not alone. You may also be able to help someone else by sharing your story. Here are some options for connecting with other survivors:

- Support Groups
  - Cancer Support Community hosts support groups around the country.
  - Visit cancersupportcommunity.org or call (888) 793-9355.
- Ask your healthcare team about other groups in your area or at your hospital.
- One-on-One Partnering Organizations
  - These organizations connect you with a fellow survivor. Usually the connections happen via phone.
- Imerman Angels
  - Visit imermanangels.org or call (877) 274-5529.
- Cancer Hope Network
  - Visit cancerhopenetwork.org or call (800) 552-4366.
- Survivor Retreats
  - Epic Experience offers outdoor adventure retreats to adults with a past cancer diagnosis. Activities are based on the season.
  - Visit epicexperience.org or call (855) 650-9907.
- First Descents hosts retreats for young adults (18-39) to learn to rock climb, kayak, or surf.
  - Visit firstdescents.org or call (303) 945-2490.

Educate yourself.
Knowledge is power. Talk to your oncologist about your fear of recurrence. Here are some questions to ask:
What are my chances of recurrence?  
What can I do to lower my risk?  
What signs do I need to look for to know if my cancer has returned?

Armed with the answers to these questions you can better understand your situation and minimize fear of the unknown.  
If you do face a recurrence, remember that every survivor’s situation is different. With clinical trials and new medications, there may be many treatment options available. Not all recurrences are equal.

**Know what triggers your emotions, and avoid it.**  
Do movies or TV shows that address cancer upset you? Don’t watch them. Does the sight of the sweatshirt you wore on treatment days bother you? Throw it out or donate to a clothing bank. Do you get especially anxious around scan days? Ask a friend to go to lunch with you.  
If you can identify the objects or activities that trigger negative feelings, you can make a special effort to avoid them.  

**Don’t dismiss your fear.**  
It is normal and understandable to fear recurrence. A cancer diagnosis is a scary thing. If you’ve already been through treatment, you know how difficult it can be. Don’t be too hard on yourself. It is okay to be scared. It is okay to be upset. Admitting your feelings can be an important first step to managing your emotions.  
Remember what works for other people may not work for you. Try a few different things. Once you find an activity that makes you feel at ease, be sure to include it in your schedule. Take time for yourself.  
If your fear of recurrence becomes overwhelming or interferes with your day-to-day activity, talk to your doctor. You may need individual counseling from a medical professional. Your doctor can make a recommendation for you.  

**Immunizations for Cancer Survivors**

**What are immunizations?**  
Immunizations help your body build a resistance to specific diseases. Most immunizations work by introducing a small, safe amount of the disease to your immune system. This way if you are ever exposed to the disease, your body’s immune system already knows how to fight it. Most immunizations are vaccines given as a shot or series of shots.  
Many people receive one-time immunizations when they are children for diseases such as chickenpox. Some immunizations, such as tetanus shots, need boosters to keep them effective. Other immunizations, such as flu vaccines, need to be received annually.  

**What are the risks of vaccines?**  
As with any treatment or medication, vaccines can cause side effects. Each vaccine carries risk for different side effects. Most side effects are minor such as pain where you receive the shot and mild fever. There are risks for serious side effects, but vaccines are carefully tested
for safety. In most cases, the great benefits of vaccines outweigh the minor risks. To learn more, visit the Centers for Disease Control and Prevention (CDC) at www.cdc.gov. Talk to your healthcare team about the risks and benefits of vaccines to determine what is best for you.

**I’m a cancer survivor; what immunizations do I need?**
For cancer survivors, immunizations are especially important because cancer treatments weaken the body's immune system. Below is the immunizations schedule recommended by the CDC for people with weakened immune systems, such as cancer survivors.

<table>
<thead>
<tr>
<th>Vaccine</th>
<th>Schedule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Influenza (flu)</td>
<td>Annually</td>
</tr>
<tr>
<td>Tetanus, diphtheria, pertussis (Td/Tdap)</td>
<td>One Tdap vaccine with Td booster every 10 years.</td>
</tr>
<tr>
<td>Varicella (chickenpox)*</td>
<td>Should NOT get vaccine**</td>
</tr>
<tr>
<td>HPV vaccine (women and men)*</td>
<td>3 doses through age 26</td>
</tr>
<tr>
<td>Zoster (shingles)</td>
<td>Should NOT get vaccine**</td>
</tr>
<tr>
<td>Measles, mumps, rubella (MMR)*</td>
<td>Should NOT get vaccine**</td>
</tr>
<tr>
<td>Pneumococcal (PCV13)</td>
<td>1 dose</td>
</tr>
<tr>
<td>Pneumococcal (PPSV23)</td>
<td>1 or 2 doses</td>
</tr>
<tr>
<td>Meningococcal</td>
<td>1 or more doses</td>
</tr>
<tr>
<td>Hepatitis A*</td>
<td>2 doses</td>
</tr>
<tr>
<td>Hepatitis B*</td>
<td>3 doses</td>
</tr>
</tbody>
</table>

Source: Center for Disease Control

* These vaccines are only for adults who did not get them as children.

** If you received these vaccines before your cancer diagnosis, there is no harm done. In fact, it is good that you are protected from these diseases. If you have not received these vaccines, it is not safe to receive them with a weakened immune system.

If you are planning to travel outside of the United States, check the recommended vaccines for where you are going. You may need additional immunizations.

Always consult with your oncologist before receiving any vaccine.

**What else do cancer survivors need to know about immunizations?**

**Influenza (Flu)**
If you are a cancer survivor, the CDC recommends getting the annual flu vaccine. However, only get the flu shot; do NOT get the nasal spray version. The nasal spray version contains live viruses so it is not safe for people with a compromised immune system.
Caregivers or anyone living with a cancer survivor should also receive the flu vaccine to lower the risk of infection.

**Pneumococcal**

There are two pneumococcal vaccines: PVV13 and PPSV23. For cancer survivors, doses of each may be needed. Ask your healthcare team about the best pneumococcal schedule for you.

**Meningococcal, Hepatitis A and B**

These vaccines are recommended for adults with certain jobs, lifestyles, or other health factors that increase their risk of these diseases. Your healthcare team can tell you if you are at a higher risk.

**Varicella, Zoster, and MMR**

As shown in the chart above, people with a compromised immune system, such as cancer survivors currently or recently out of treatment, should NOT receive these vaccines.

**Smoking Cessation**

**Why is smoking bad?**

Smoking increases your risk for heart disease, stroke, and emphysema. Smoking also increases your risk for a number of cancers, including:

- Lung
- Oral
- Nasal and Paranasal
- Throat
- Esophageal
- Bladder
- Kidney
- Pancreatic
- Ovarian
- Cervical
- Colorectal
- Stomach

If you already have a cancer diagnosis, smoking can increase your risk of recurrence.

**Why should I quit?**

Quitting smoking has almost immediate benefits. Here are some of the benefits of quitting smoking:
<table>
<thead>
<tr>
<th>Time Since Quitting</th>
<th>Benefit</th>
</tr>
</thead>
<tbody>
<tr>
<td>20 minutes</td>
<td>Blood pressure and heart rate drop</td>
</tr>
<tr>
<td>12 hours</td>
<td>CO2 levels in blood stream return to normal*</td>
</tr>
<tr>
<td>3 months – 9 months</td>
<td>Circulation and lung function improve</td>
</tr>
<tr>
<td>1 year</td>
<td>Risk of heart disease cut in half</td>
</tr>
<tr>

Source: smokefree.gov

*If the CO2 (carbon dioxide) levels in your bloodstream are high, your lungs have to work harder to return these levels to normal. When you exhale, CO2 leaves your body.

**How can I quit?**

The first step is to talk to your healthcare team about the best quitting strategies for you.

With smoking, your body builds up a dependency on nicotine, a chemical found in tobacco. As you quit smoking, your body will go through withdrawals from nicotine. Some common symptoms and side effects of withdrawal include:

- Cravings
- Feelings of sadness
- Stress and anxiety
- Difficulty sleeping
- Restlessness
- Weight gain

**Here are some tips to help you manage the side effects of withdrawal:**

- With your doctor’s permission, you may wish to use nicotine replacement therapies (NRT).
  - NRTs give you a small, decreasing dose of nicotine without smoking to help you wean yourself off nicotine and minimize withdrawal symptoms.
  - NRTs come in many forms such as gum, lozenges, inhalers, and patches.
  - Some NRTs are available without a prescription, but always talk to your healthcare team first.
Other prescription medications are available to help you quit. Check with your doctor to see if these may be right for you.

- Tell your friends and family that you are trying to quit.
  - They can support you and hold you accountable.
  - Ask a friend or family member you trust to be your “sponsor.” If you feel the urge to smoke, you can call them to talk until the craving passes.
  - If your friends or family members smoke, ask them not to smoke around you and not to offer you cigarettes. This will only make achieving your goal harder.
- Join a support group or online support group to connect with other people trying to quit.
- Change your routine.
  - For example, if you always have a cigarette with your coffee, find a new morning routine. Try watching the news with your coffee, or replace your cigarette with a healthy snack.
- Know your triggers and have a plan.
  - What triggers your cravings—stress, food, other people smoking?
  - Avoid triggers if at all possible.
  - If you encounter a trigger, have a plan to keep yourself from smoking such as chewing gum, counting to 10, or calling a friend.
- If you have a setback, don’t be too hard on yourself. Get back on track as soon as possible. However, do not use a slip as an excuse to start smoking regularly again.
- Do not use other tobacco products or e-cigarettes as a replacement for smoking.
  - Other tobacco products can also increase your risk for cancer and diseases.
  - E-cigarettes have not been studied enough to know their safety. The chemicals inhaled with e-cigarette use may have their own risks.

Resources for Quitting

Call (800) Quit-Now to connect with your state’s helpline.
The following worksheets can help you organize your life and keep track of all your information during your cancer journey. If you visit, My PearlPoint at my.pearlpoint.org and sign up for a personalized dashboard, you can print as many worksheets as you need.

- My Diagnosis
- Questions for Your Healthcare Team
- My Medical History
- My Immunizations Record
- Appointment Notes
- My Healthcare Team Contact List
- Treatments and Side Effects Logs
- Laboratory Flow Sheet
- Budgeting Worksheets
- Calendars
My Diagnosis

Your Healthcare team will give you details about your diagnosis. Ask your nurse navigator to fill out this worksheet to help you better understand you diagnosis.

Note: Some questions do not apply to some cancers.

What is my diagnosis?

Tumor location: Draw the location of the tumor.

Liver, Pancreas, Gallbladder and Bile Passage
Tumor size: Tumor size is the largest dimension of the tumor. Use these images to understand the size of your tumor. What is the size of your tumor?

Are any of my lymph nodes involved? If so, how many?

What is the stage of the cancer?

Are there any metastasis?

Other information:
Questions for Your Healthcare Team

When you are diagnosed with cancer, you may feel overwhelmed with information. Ask your oncologist the following questions to make sure you have the answers you need.

What is my diagnosis?
__________________________________________________________
__________________________________________________________

What stage is my cancer? What is my prognosis?
__________________________________________________________
__________________________________________________________

What are my treatment options? What would you recommend?
__________________________________________________________
__________________________________________________________

Am I eligible for a clinical trial?
__________________________________________________________
__________________________________________________________

What are the long-term and short-term side effects of treatment? How will these affect my normal activities?
__________________________________________________________
__________________________________________________________

How can I manage these side effects?
__________________________________________________________
__________________________________________________________

How can I keep myself as healthy as possible during treatment?
__________________________________________________________
__________________________________________________________
Will I be able to have children? What are my options to preserve fertility?

_______________________________________________________

Where can I find help with financial concerns?

_______________________________________________________

Where can I find help with lodging or transportation?

_______________________________________________________

What will my follow-up care plan include?

_______________________________________________________
My Medical History

Your healthcare team will need to know your medical history so they can determine the care that is best for you. They may have specific forms for you, but this form will help you collect basic information you will need before your appointments.

Basic Information

Name:
Birthdate:
Phone Number(s):
Address:

Social Security Number:
Employer:
Spouse’s Name:
Spouse’s Phone Number:
Emergency Contact:
Emergency Contact’s Phone Number(s):

My Immunization Record

For cancer patients, immunizations are especially important because cancer treatments weaken the body’s immune system. Immunizations help your body build a resistance to specific diseases. Most immunizations work by introducing a small, safe amount of the disease to your immune system. This way if you are ever exposed to the disease, your body’s immune system already knows how to fight it. Ask your healthcare team which immunizations you need. Use this chart to keep track of your immunization record.

Laboratory Flow Sheet

Your healthcare team monitors the effects and toxicity of chemotherapy treatments by watching your Complete Blood Count and Differential (CBC) results. These ranges are listed on the report your doctor receives after routine blood work. Use this report or ask your healthcare team to help you fill out the sheet below so you can monitor your CBC.

If you notice a change in levels, ask your healthcare team for an explanation. Lab work will be ordered for your needs. Lab work may vary slightly between males and females and between different labs.

Lab Reports and Terminology

Complete Blood Count and Differential

Your WBC, RBC, HGB, HCT, PLT, and MVP will be monitored throughout the course of your treatment. These lab results give important information about how your body is affected by the chemotherapy.

**WBC:** white blood cells or leukocytes. White blood cells help the body to fight infections. There are several different types of white cells that have different functions. The WBC is the total of all the white cells counted.

**RBC:** red blood cells. These are also called erythrocytes or corpuscles. Immature red blood cells are called reticulocytes. RBCs carry oxygen from the lungs to the tissues of the body.

**HGB:** hemoglobin. Hemoglobin is the pigment of the red blood cells that actually carries the oxygen.

**HCT:** hematocrit. This is the percentage of RBCs in the volume of the whole blood in your body. This is also called packed cell volume or PCV.

**PLT:** platelets or thrombocytes. These cells help the blood to form a clot when your body has had a trauma or is bleeding.

MCH, MCHC, MCV, RBC, HCT, HGB all give us information in the diagnosis of anemia. Anemia is defined as a lack of the proper amount of red blood cells.

**MVP:** mean platelet volume. This is the average volume of platelets. A high MPC means there is the presence of larger platelets. A low MPV indicates the platelets are smaller than normal.

**MCV:** mean corpuscular volume. This is the calculation of the average volume of the RBC and is determined by the hematocrit count divided by the RBC count.

**MCH:** mean corpuscular hemoglobin. This is the calculation of the average weight of Hgb of each RBC. This is determined by the hemoglobin divided by the RBC.

**MCHC:** mean corpuscular hemoglobin concentration. This number tells us the concentration of hemoglobin in an average RBC. It is calculated by dividing hemoglobin by hematocrit.

**RDW:** red cell distribution width. This is the numerical expression of the degree of variation in the volume of the population of red blood cells. Normally, as new normal sized cells are produced, the RDW increases.
**Differential:** a differential count calculates the total white blood cells and categorizes their different types. The differential is reported as a percentage and an absolute number by type of cell.

**Other Terminology**

**Granulocyte:** white blood cells with a grainy appearance under a microscope. Neutrophils, eosinophils, and basophils are all granulocytes. Neutrophils are further classified as either bands or segs. This defines the level of maturity of these cells. These cells fight infection.

**Polymorphonuclear leukocytes:** also called PMNs or Polys. These refer to granulocytes which are neutrophils, eosinophils, and basophils. The name means “possessing a nucleus (or center) consisting of many parts or lobes.” This is another descriptive name for white blood cells.

**Blast, myelocyte, metamyelocyte, progranulocyte:** these are immature WBCs that are not normally in the peripheral blood circulation.

**ANC:** absolute neutrophil count. Neutrophils are white blood cells that help the body fight infection. This number is used to monitor neutropenia and the effects of chemotherapy and colony stimulating factors.
## Budgeting Worksheets

### Sources of Income:

<table>
<thead>
<tr>
<th>Sources of Income</th>
<th>Expected</th>
<th>Actual</th>
