# Overview of the Myelodysplastic Syndromes (MDS)

Brian A. Jonas, M.D., Ph.D. UC Davis School of Medicine February 4, 2017

# What do these individuals have in common?

- 1) Astronomers
- 2) Newscasters
- 3) Politicians
- 4) MDS

#### **MDS** Questions to be Answered

- What is MDS?
- Why did I get MDS?
- What does it mean for my life?
- Is there treatment for it?
- How should I be treated?
  - When?
  - Why?
- What are some of the new advances in MDS?

### **Essentials for the Informed Pt with MDS**

- Know your IPSS-R risk group
- Know your treatment options
   Including transplant, clinical trials
- Know what your treatment goals are
- Know the potential side effects of your treatments
- Know available MDS resources
- Have a caregiver available/involved

# The Myelodysplastic Syndromes

## The Myelodysplastic Syndromes (MDS)

- Heterogeneous group of clonal bone marrow failure syndromes
- 10-30,000 cases per year in US
- Median age 76, > in males
- Ineffective hematopoiesis

   Bleeding, infections, anemia
- Transformation to AML
- Variable clinical course
  - Need for accurate prognostication

List et al. NEJM 2005. Ma et al. Cancer 2007.

# Epidemiology of MDS

#### **MDS Incidence Increases With Age**

Aul et al. Leuk Res 1998. Radlund et al. Eur J Haematol 1995.

### **Predispositions and Risk Factors for MDS**

- Acquired Risk Factors (common)
  - Age
  - Mutagen exposure (chemotherapy, radiation, benzenes, tobacco)
  - Other hematologic disorders (e.g. AA, PNH)
- Heritable Predisposition (rare)

# Pathogenesis of MDS

#### MDS is Like a Broken Down Assembly Line

### Normal and Dysplastic Hematopoiesis

Dysfunctional progression along the maturation pathway

### Pathogenesis of MDS

#### Aging is Associated with Clonal Hematopoiesis with Driver Mutations

Jaiswal et al, NEJM, 2014. Genovese et al, NEJM, 2014.

#### **MDS is a Cancer**

#### A Clonal Evolution from MDS to sAML

# The MDS "Stem Cell" is the primitive Hematopoietic Stem Cell

Nilsson et al. Blood 2007. Tehranchi et al. NEJM 2010. Pang et al. PNAS 2013.

### MDS is Associated with Chromosome Abnormalities...

Olney et al. Leuk Res 2006.

#### **Recurrent Mutations in MDS**

## Presentation and Diagnosis of MDS

### **MDS** Presentation

- Symptoms
  - Some are asymptomatic
  - Fatigue
  - Weakness
  - Bruising
  - Infections

- Signs
  - Pallor
  - Ecchymoses
- CBC
  - Anemia (most common)
    - Macrocytic
  - Neutropenia
    - Pelger-Huet cells
  - Thrombocytopenia

### **Diagnosis of MDS**

Bone Marrow Biopsy and Aspirate

Morphology

### **Differential Diagnosis of MDS**

Spectrum of Indolent Myeloid Hematopoietic Disorders <sup>2,3</sup>					
Feature	ICUS	IDUS	CHIP	CCUS	MDS
Somatic mutation	-	-	<b>+/-</b> <sup>1</sup>	<b>+/-</b> <sup>1</sup>	+/-
Clonal karyotypic abnomality	-	-	<b>+/-</b> <sup>1</sup>	<b>+/-</b> <sup>1</sup>	+/-
Marrow dysplasia	-	+	-	-	+
Cytopenia	+	-	-	+	+

ICUS, idiopathic cytopenia of unknown significance; IDUS, idiopathic dysplasia of unknown significance; CHIP, clonal hematopoiesis of indeterminate potential; CCUS, clonal cytopenia of unknown significance; MDS, myelodysplastic syndromes

- Acute myeloid leukemia
- Other MPNs
- Aplastic anemia
- Nutritional deficiencies
- Medications

# **Prognostication of MDS**

#### **Prognostic Features in MDS**

#### • <u>Clinical</u>

- CBC, marrow blasts, cytogenetics
- Age, PS, ferritin, LDH,  $\beta$ 2M, marrow fibrosis
- Treatment/Response
- <u>Molecular</u>
  - Specific mutations
  - Number of mutations

### FAB and 2008 WHO Classification of MDS

French-American-British (FAB)	2008 World Health Organization (WHO)
Refractory Anemia (RA)	Refractory Cytopenia with Unilineage Dysplasia (RCUD)
и	RC with Multilineage Dysplasia (RCMD)
<i>u</i>	MDS associated with isolated del(5q)
RA with Ringed Sideroblasts (RARS)	RARS with unilineage dysplasia
	RCMD with ringed sideroblasts
RA with Excess Blasts (RAEB)	RAEB-1 (5-9% blasts)
<i>u</i>	RAEB-2 (10-19% blasts)
RAEB in Transformation (RAEB-T)	Acute Myeloid Leukemia (20+% blasts)
Chronic Myelomonocytic Leukemia (CMML)	MDS/MPN Overlap
N/A	MDS Unclassified (MDS-U)

### 2016 WHO Classification of MDS

Subtype	Blood	Bone marrow
MDS with single lineage dysplasia (MDS-SLD) <sup>3</sup>	Single or bicytopenia	Dysplasia in ≥10% of one cell line, <5% blasts
MDS with ring sideroblasts (MDS-RS)	Anemia, no blasts	≥15% of erythroid precursors w/ring sideroblasts, or ≥5% ring sideroblasts if SF3B1 mutation present
MDS with multilineage dysplasia (MDS-MLD)	Cytopenia(s), <1 x 10º/L monocytes	Dysplasia in ≥10% of cells in ≥2 hematopoietic lineages, ± 15% ring sideroblasts, <5% blasts
MDS with excess blasts-1 (MDS-EB-1)	Cytopenia(s), ≤2%–4% blasts, <1 x 10º/L monocytes	Unilineage or multilineage dysplasia, 5%–9% blasts, no Auer rods
MDS with excess blasts-2 (MDS-EB-2)	Cytopenia(s), 5%–19% blasts, <1 x 10º/L monocytes	Unilineage or multilineage dysplasia, 10%–19% blasts, ± Auer rods
MDS, unclassifiable (MDS-U)	Cytopenias, ±1% blasts on at least 2 occassions	Unilineage dysplasia or no dysplasia but characteristic MDS cytogenetics, <5% blasts
MDS with isolated del(5q)	Anemia, platelets normal or increased	Unilineage erythroid dysplasia, isolated del(5q), <5% blasts
Refractory cytopenia of childhood	Cytopenias, <2% blasts	Dysplasia in 1–3 lineages, <5% blasts
MDS with excess blasts in transformation (MDS-EB-T) <sup>2</sup>	Cytopenias, 5%–19% blasts	Multilineage dysplasia, 20%–29% blasts, ± Auer rods

# International Prognostic Scoring System for MDS (IPSS)

#### International Prognostic Scoring System (IPSS)<sup>s,t</sup>

Survival and AML	evoluti	on			
		Score value			
Prognostic variable	0	0.5	1.0	1.5	2.0
Marrow blasts (%) <sup>u</sup>	<5	5-10		11-20	21-30
Karyotype <sup>v</sup>	Good	Intermediate	Poor		
Cytopenia <sup>w</sup>	0/1	2/3			

IPSS Risk category (% IPSS pop.)	Overall score	Median survival (y) in the absence of therapy	25% AML progression (y) in the absence of therapy
LOW (33)	0	5.7	9.4
INT-1 (38)	0.5-1.0	3.5	3.3
INT-2 (22)	1.5-2.0	1.1	1.1
HIGH (7)	≥2.5	0.4	0.2

**Cytopenias**: <u>Hgb</u> < 10 <u>ANC</u> < 1800 <u>Plt</u> < 100,000

#### Cytogenetics:

<u>Good</u> – normal, -Y only, del(5q) only, del(20q) only <u>Intermediate</u> – +8, single misc, double abnormalities <u>Poor</u> – complex (≥3), abnormality of chromosome 7 **IPSS** 

Greenberg et al. Blood 1997.

#### **Revised International Prognostic Scoring System**

- IPSS-R built upon prior IPSS
- Multinational IWG-PM project
- 7,012 patients with median age 71
- MDS classified by FAB and WHO
- New MDS cytogenetic classification
- Considered depth of cytopenias, age, LDH, ferritin, b2M, fibrosis, and PS

Greenberg et al, Blood 2012. Schanz et al, JCO 2012.

#### **IPSS-R: Determining the Score**

**IPSS-R Score Values** 

Variable	0	0.5	1	1.5	2	3	4
Cytogenetics	Very Good		Good		Intermediate	Poor	Very Poor
Marrow blasts (%)	≤2		>2-<5		5-10	>10	
Hemoglobin	≥10		8-<10	<8			
Platelets	≥100	50-<100	<50				
ANC	≥0.8	<0.8					

Cytogenetic Risk	Abnormalities
Very Good	-Y, del(11q)
Good	Normal, del(5q), del(12p), del(20q), double including del(5q)
Intermediate	del(7q), +8, +19, i(17q), any other single or double
Poor	-7, inv(3)/t(3q)/del(3q), double including - 7/del(7q), complex = 3
Very Poor	Complex >3

Greenberg et al, Blood 2012.

#### **IPSS-R: Calculating the Score**

IPPS-R Risk	IPSS-R Score	Median OS (yr)	25% AML Progression (yr)
Very Low	≤1.5	8.8	NR
Low	>1.5-3	5.3	10.8
Intermediate	>3-4.5	3	3.2
High	>4.5-6	1.6	1.4
Very High	>6	0.8	0.7

#### **IPSS-R: Survival and AML Progression**

• CBC values, bone marrow blasts, cytogenetics

Greenberg et al, Blood 2012. Schanz et al, JCO 2012.

#### **Recurrent and Prognostic Gene Mutations**

Function	Gene		
Epigenetic/Chromatin Modifiers	TET2, DNMT3A <sup>#</sup> , ASXL1, EZH2		
Splicing	SF3B1, SRSF2, U2AF1 <sup>#</sup> , ZRSR2		
Differentiation	RUNX1		
DNA Damage Response/Apoptosis	TP53 <sup>*</sup> , BCOR		
Cohesin Complex	STAG2		
Signaling	CBL		

Recurrent in >5% of MDS patients across multiple studies **Favorable** prognostic impact **Negative** prognostic impact **Neutral** prognostic impact \*Strong negative prognostic impact in therapy-related MDS #Strong negative prognostic impact in CMML

Table adapted from: Haferlach et al, Leukemia 2014; Bejar et al, NEJM 2011; Papaemmanuil et al, Blood 2013; Walter et al, Leukemia 2013; and Thol et al; Blood 2012.
### Combining Mutations with IPSS Can Improve Prognostication

### IPSS and TP53, EZH2, ETV6, RUNX1 and ASXL1 mutations

From Bejar et al, NEJM 2011.

### **Revised IPSS-R: Incorporation of Mutations**

Model:

Gender, Age, IPSS-R Variables Mutations in: ASXL1, CBL, ETV6, EZH2, KRAS, LAMB4, NCOR2, NF1, NPM1, NRAS, PRPF8, RUNX1, TET2 and TP53

### **Treatment of MDS**

### **Considerations for MDS Therapy**

- Age, comorbidity, quality of life, and psychosocial assessments
- Treatment goals based on risk and mode of disease-related mortality
- All patients get "best supportive care"
  - Transfusions for anemia, thrombocytopenia
  - Antibiotics -/+ G-CSF for infections
- Iron chelation therapy may be required

### **FDA Drug Approvals**

- Epo 1993; Darbepoetin 2002
  - for chemotherapy-induced anemias
- GCSF 1996; Peg-GCSF 2002
  - for infection ( '93 w/ Epo SUH)
- Azacitidine 2004
- Lenalidomide 2005 for (del)5q MDS
- Decitabine 2006
  - 2010: 5 day outpt regimen
- Deferasirox 2005; Deferiprone 2011
  - for iron chelation

### **Treatment Approaches in MDS**

\* Differentiating features: age, performance status, ferritin, LDH

### **Treatment Options for Lower Risk MDS**

- Supportive care (transfusions, antibiotics)
- Anemia (EPO<500): Erythroid Stimulating Agents (ESAs)
  - Erythropoietin (Procrit/Epogen)
  - Darbepoetin (Aranesp) +/- G-CSF (Neupogen)
- 5q-: Lenalidomide (*Revlimid*)
- non-5q-: Lenalidomide (*Revlimid*) +/- Erythropoietin (*Procrit/Epogen*)
- Int-1/'young': ATG, cyclosporin
- RBC transfusions >20-30u: Iron chelation
  - Deferasirox (*Exjade* oral) or Deferoxamine (*Desferal* sc)
  - If ferritin >2500, goal is <1000</li>
- Thrombocytopenia:
  - [Eltrombopag (*Promacta*), Romiplostim (*Nplate*)]
- Neutropenia: G-CSF (*Neupogen/Neulasta*)
- Clinical trials

### Therapeutically Targeted Subtypes of MDS

- RARS
- 5q-
- Hypoplastic/<60yo HLA-DR15+
- CMML w/ t(5q31-33)/ PDGFR $\beta$  gene rearrang' t

- GCSF + Epo
- Lenalidomide
- Immunosuppression (ATG, CSA)
- Imatinib

### Lenalidomide is Effective for MDS with del(5q)

### Figure 1. Kaplan–Meier Estimate of the Duration of Independence from Red-Cell Transfusion.

Circles represent censored data from patients who remained transfusionfree at the time of data cutoff (July 15, 2005) or at the time of study discontinuation. On the x axis, 0 indicates the day after the patient's last transfusion preceding a response to treatment. After a median follow-up of 104 weeks, the median duration of transfusion independence could not be estimated.

### Lenalidomide is Effective for MDS with del(5q)

Table 2. Erythroid Response to Lenalidomide.					
Variable	Continuous Daily Dosing (N=102)*	21-Day Dosing (N=46)*	All Patients (N=148)		
Transfusion independence	71 (70)	28 (61)	99 (67)		
95% CI		(/	59-74		
≥50% decrease in no. of transfusions	8 (8)	5 (11)	13 (9)		
95% CI			5–15		
Total transfusion response	79 (77)	33 (72)	112 (76)		
95% CI			68–82		
Time to response — wk					
Median	4.7	4.3	4.6		
Range	1-34	1–49	1–49		
Hemoglobin — g/dl					
Baseline†					
Median	7.7	8.0	7.8		
Range	5.3-10.4	5.6-10.3	5.3-10.4		
Response <u></u>					
Median	13.4	13.5	13.4		
Range	9.2-18.6	9.3-16.9	9.2-18.6		
Increase					
Median	5.4	5.4	5.4		
Range	2.2-11.4	1.1-9.1	1.1–11.4		

\* The daily dose was 10 mg.

<sup>+</sup> The baseline hemoglobin concentration was the minimum value during the baseline period.

The response hemoglobin concentration was the maximum value during the transfusion-independent response period.

### Lenalidomide is Also Effective for non-del(5q)

Phase II Study of Lenalidomide in Low and Int-1 Risk MDS with Normal or Abnormal Karyotypes Other than del(5q) <sup>a,1</sup> (n=214)						
	Lenalidomide 10 mg q day (n=100)	Lenalidomide 10 mg q day X 21 days every 28 days (n=114)	All Patients			
Erythroid Response: Transfusion- independence <sup>b,c</sup>	27%	25%	26%			
Median Time to response (weeks)	7.4	4.1	4.8			
Baseline Hb (gm/dL)	7.9	8.1	8.0			
Median Hb at Response (gm/dL)	11.6	11.0	11.6			
Median Increase in Hb (gm/dL)	3.3	3.1	3.2			

<sup>a</sup> IPSS: 79% low and int-1, 4% int-2, 18% indeterminate; 83% IPSS cytogenetic group good, 13% intermediate, 1% poor, 3% missing

b 19% patients had cytogenetic response with 8% patients with complete cytogenetic remission

° Median duration of transfusion-independence was 41 weeks for median follow-up of 76 weeks

#### Toxicities (all patients):

Neutropenia, grade 3-4	25%
Thrombocytopenia, grade 3-4	20%
Rash, grade 3-4	4%
Autoimmune hemolytic anemia	3%

Raza et al. Blood 2008.

### **Treatment Options for Higher Risk MDS**

- Supportive care (transfusions, antibiotics)
- Low intensity therapy
  - Azacitidine (*Vidaza*)
  - Decitabine (Dacogen)
  - Clinical trial
- High intensity therapy
  - Intensive chemotherapy (standard or clinical trial)
  - Stem Cell Transplant (standard or reduced intensity)
     --donor available, performance status, age

### HMA inhibit DNA methyltransferases and induce DNA Hypomethylation and Gene Activation

- Hypomethylating agents: 5-Azacitidine (AZA) and 5-aza-2'-deoxycytidine (Decitabine/DAC)
- Pyrimidine nucleoside analogs
- AZA/DAC are incorporated into DNA in lieu of cytosine residue
- Leads to inactivation of DMT
- Leads to formation of newly synthesized DNA with unmethylated cytosine residues
- Results in hypomethylation and transcription of previously quiescent genes

# AZA-001 – AZA vs Conventional Care in Higher Risk MDS

Higher Risk MDS (IPSS Int-2 or HR) FAB-defined P3, international, multicenter, randomized AZA: 75mg/m2 SC days 1-7 every 28 days (at least 6 cycles) BSC: transfusions, G-CSF (for febrile neutropenia) LDAC: 20mg/m2 SC days 1-14 every 28 days (at least 4 cycles) IC (7+3 chemo): Cytarabine 100-200mg/m2/day CIV x7d Anthracycline IV daily x3d

Fenaux et al. Lancet Oncology 2009.

# AZA-001: Hematologic Improvement (2000 IWG)

Fenaux et al. Lancet Oncology 2009.

### Azacitidine (HMA) Significantly Improves Survival in Higher Risk MDS

Cl=confidence interval; HR=hazard ratio; ITT=intent-to-treat.

### EORTC-06011: Randomized Phase 3 Study of Low-Dose Decitabine vs BSC for Higher-Risk MDS

### EORTC-06011: Overall Survival

Lubbert et al, JCO 2011.

### EORTC-06011: Response and Toxicity

Response	BSC	Decitabine
CR	0%	13%
PR	0%	6%
Н	2%	15%
SD	22%	14%
PD	68%	29%
Hypoplasia	0%	14%
Inevaluable	8%	8%

### Decitabine arm:

26% went off protocol for treatment completion 16% for toxicity

Why no survival advantage?

Limited courses?

More poor risk cytogenetics, older, lower PS?

Dosing/schedule?

Aza is better?

	BSC (n = 1	BSC (n = 114)		oine 14)*
Adverse Event	No. of Patients	%	No. of Patients	%

### CALGB 9221: Responses in Lower-Risk MDS

### Median time to response: 2 mos Median duration of response: 15 mos (all pts)

HI: 50% improvement in 1 or 2 peripheral blood counts or 50% decrease in transfusion requirements

PR: 50% improvement in 3 peripheral blood counts and transfusion independent and ≤50% initial marrow blasts

CR: Normalization of peripheral blood counts and ≤5% marrow blasts

Silverman et al. JCO 2002

### Decitabine after AZA Failure can salvage some patients

Figure 1. Overall survival of all the 14 patients.

					-				
	Number of prior Aza courses	Best response to Aza	Reason off Aza/weeks off Aza	Weeks from prior Aza before DAC	Best response to DAC/courses to response	Response duration (months)	Percent marrow blasts pre/at response	Platelets pre/at response	ANC pre/at response
1	8	Marrow CR	PD	3	CR/3	9.7	15/1	24/336	1.1/3.2
2	4	SD	NR	11	Marrow CR/3	8.2	8/4	65/95	1.8/5.1
3	4	SD	NR	9	CR/5	11.3 +	12/3	80/234	0.6 - 1.4
4	1	N/A	Toxicity	5	CR/1	10.2	13/4	24/110	0.38/2.8

Table III. Characteristics of responders.

CR, complete remission; Aza, azacitidine; DAC, decitabine; SD, stable disease; PD, progressive disease; NR, no response; ANC, absolute neutrophil count.

### Decitabine 20mg/m2 IV days 1-5 on a 28-day cycle

#### Borthakur et al. Leuk Lymph 2008.

### HR MDS Post HMA Failure OS by Salvage Rx

#### 2014 ASH Abstracts:

3275 (Nazha et al.): IPSS-R best predicts outcomes

3273 (Nazha et al.): SD after 6mo unlikely to improve -> clinical trials

Prébet et al. JCO 2011.

### LR MDS Post HMA Failure OS by Salvage Rx

Jabbour et al. ASH 2013 abstract 388

### **Induction Chemotherapy for MDS**

#### Retrospective, MD Anderson Experience n=394 (no 5q- patients included)

Induction	Regimen a
-----------	-----------

	IA	FA	FAI	TA	CAT	Total
Number of patients	67	76	118	74	59	394
Median age, years	58	63	62	64	63	
FAB: RAEB	21%	33%	33%	47%	31%	
RAEB-T	79%	69%	67%	53%	69%	
IPSS: Int-1	17%	18%	7%	21%	17%	
Int-2	40%	33%	37%	38%	42%	
High	42%	48%	56%	41%	42%	
Early death (first 6 weeks)	15%	18%	21%	5%	15%	
Overall CR rate	72%	61%	48%	59%	58%	58%
IPSS: Int-1						64%
Int-2						60%
High						56%
Median survival <sup>b</sup> , weeks	88	33	30	45	(c)	
IPSS: Int-1						85
Int-2						45
High						38
Median survival <sup>b</sup> for patients achieving CR (n=229), weeks	91	30	36	41	(c)	
IPSS: Int-1						77
Int-2						54
High						31

<sup>b</sup> After achieving CR, most patients proceeded to consolidation chemotherapy, and some patients (0–11% across the five regimens) proceeded to HSCT

# CR 40-60%, median duration CR <1yr Early mortality 17%, 5yr OS 8%

Consider in: Younger fit patients <65-70 High blast percentage (>10%) Non-adverse cytogenetics Transplant candidate with donor Post-remission chemotherapy should be given

Beran et al. Cancer 2001. Kantarjian et al. Cancer 2006. Knipp et al. Cancer 2007. Malcovati et al, Blood, 2013.

# HMA vs Induction chemotherapy in MDS with 10-30% blasts

 330 pts: 93 (28%) Rx with HMA and 237 (72%) with chemo Rx

Parameter	HMA	Intensive Chemo Rx	p value
-% CR + CRp	42	60	.01
-Median Rem. dur. (mos)	14.7	14.7	
-%8-wk mortality	10	13	
-median OS (mos)	18.8	14.6	.32

• Multivariate analysis: worse OS with chemo Rx

### Allogeneic Transplant Can Cure MDS

Retrospective analysis GITMO Adjusted for age, IPSS, donor type and conditioning intensity

Alessandrino et al. JCO 2013.

### Timing of Allogeneic Transplant in MDS

Retrospective analysis of MDS patients <60 with MA MRD allo-HCT or 60-70yo with RIC MRD allo-HCT using a Markov decision model.

Figure 3. Net benefit or loss of overall discounted life expectancy for the 4 IPSS risk groups are shown above and below the x-axis. A net benefit for delaying transplantation is noted for low and int-1 risk groups, whereas any delay in the time to transplantation is associated with a loss in survivorship in the higher risk groups.

<60yo: Cutler et al. Blood 2004.

Della Porta et al, ASH 2014 Abstract#531: IPSS-R Int should be considered for Allo-HCT

60-70yo: Koreth et al. JCO 2013.

### **Pre-Transplant Therapy in MDS**

- Pretransplant blasts >5% and failure to achieve CR correlate with relapse with RIC HCT
- Retrospective analyses of IC before HCT show no convincing evidence
- No significant differences in outcomes between HMA and IC pre-transplant
- No significant benefit of HCT after HMA/IC compared to upfront HCT
- High-risk MDS patients should proceed directly to transplant without delay if possible
  - Fit younger patients may benefit from "rescue" IC
  - Older patients and those with poor-risk cytogenetics may benefit from "bridging therapy" with HMA

### AZA vs IC Pre-Transplant

\*Adjusted for Cyto Risk, IPSS, Donor Source

Med age: aza 60; IC 47 High intensity: aza 40%; 100% IC RAEB-T: aza 6%; 33% IC Aza 2004-2010; IC 1992-2002

Gerds et al. BBMT 2012.

### **Iron Chelation Therapy**

- RBC transfusions: ≥20-30
- Symptomatic anemia/Further RBC txn need
   -- mainly Low, Intermediate-1 IPSS subtypes
- Evidence/pre-history of organ dysfunction
  - -- cardiac, hepatic, endocrine
- Serum ferritin >2500 $\rightarrow$ 1000;  $\uparrow$  Liver iron content
- Rx: Deferrioxamine (*Desferal*) SQ or
  - oral iron chelator Deferasirox (Exjade)

### New Advances in MDS

# **Novel Agents/Combinations in MDS**

- Lower Risk MDS:
  - Oral Azacitidine (CC-486)
  - Eltrombopag
  - Luspatercept
  - Sotatercept
- Higher Risk MDS:
  - Rigosertib
  - Azacitidine combinations
    - Vorinostat
    - Rigosertib
    - Eltrombopag
    - Birinapant
    - Lenalidomide
    - Entinostat
    - Pracinostat

- Other novel agents/combinations
  - Guadecitabine (SGI-110)
  - Sapacitabine (CYC682)
  - Clofarabine plus LDAC
  - Vosaroxin plus Decitabine
  - Ibrutinib
  - Bcl-2 inhibitors
  - PD-1 pathway inhibitors
  - IDH1/2 inhibitors
  - WT1 peptide vaccine
  - Targeted agent for splice factor mutations

# UC Davis Comprehensive Cancer Center MDS Trials

- Lower risk
   (IPSS-R VL/L/I)
- None

- Higher risk
   (IPSS-R I/H/VH)
- P1b Azacitidine + Ibrutinib
- P1 Lenalidomide + Ibrutinib

www.ucdmc.ucdavis.edu/CANCER/clinical\_trials/

# Stanford MDS Center: Biologically Focused Clinical Trials

• Lower risk: (IPSS-R VL, Low, Int)

- Luspatercept,III (TGFβ inhibitor for ring sideroblastic MDS)
- Spliceosome inhibitor, I/II (H3B-8800)

- **Higher risk:** (IPSS-R High, Very High)
- Spliceosome inhibitor,I/II (H3B-8800)
- AzaC & PD-L1 inhibitor,I/II (atezolizumab)
- RIC HSCT vs HMA,III
## **UCSF MDS Trials**

- Lower risk
  (IPSS-R VL/L/I)
- None

- Higher risk
  (IPSS-R I/H/VH)
- MDM2 inhibitor
- IDH1 inhibitor (AG-120)

# Summary and Concluding Thoughts

## **MDS Summary**

- MDS is a heterogeneous group of BM failure syndromes
- Variable clinical presentation and course
- Choice of therapy is primarily based on IPSS-R score, symptoms, age and comorbidities
- Understanding of pathogenesis, prognostication and treatment is evolving
- Novel biospecific therapies are being evaluated

## **MDS Resources**

- Leukemia and Lymphoma Society
- MDS Foundation
- Aplastic Anemia and MDS Foundation
- National Comprehensive Cancer Network (NCCN)
- UCD, UCSF and Stanford Cancer Centers
  - Brian Jonas (UCD)
  - Peter Greenberg (Stanford)
  - Rebecca Olin (UCSF)

#### **MDS** Questions to be Answered

- What is MDS?
- Why did I get MDS?
- What does it mean for my life?
- Is there treatment for it?
- How should I be treated?
  - When?
  - Why?
- What are some of the new advances in MDS?

# **Essentials for the Informed Pt with MDS**

- Know your IPSS-R risk group
- Know your treatment options
  Including transplant, clinical trials
- Know what your treatment goals are
- Know the potential side effects of your treatments
- Know available MDS resources
- Have a caregiver available/involved

## Questions?
